Platform Guideline Book

How to use every section and page of the platform: purpose, steps, outputs and mandatory inputs

BIM Management Portal · ISO 19650 & ISO/IEC 42001
Edition 0.2.0 · generated 2026-11-05 from the platform's own content

Chapters follow the sidebar. For each page: what it is for, how to use it, what it produces and what you must provide.

Contents

1. Getting started

2. How the pieces connect

3. Routes by role

4. Project workspace

- Summary
- Activity
- Process gates (every stage)
- Project assistant (AI)
- Research notebook (AI)
- Information uses
- Teams & milestones
- Responsibility matrix
- Level of information need
- Model responsibility (MRM)
- MIDP / TIDP planner
- Appointment review (AI)
- Documents
- Files
- Model validation
- Model QA/QC reviews
- Issues (BCF)
- Clash matrix
- 4D planning
- Asset tags
- Quality hub
- Requirements traceability
- Risk register
- Health & safety information
- Handover
- Meetings & progress report
- Automations
- Team training
- Team
- Project settings

5. ISO standards & learning

- Best-practice guides
- Learning paths by role
- Video library
- Our videos
- ISO 19650 adoption roadmap
- Quizzes, mock exam, scenarios
- All parts (1–6): learning hub
- Part 1
- Part 2
- Part 3
- Part 4
- Part 5
- Part 6
- 2026 revision (draft): what is changing
- Parts at a glance
- Delivery process (19650-2)
- CDE & status codes (quick reference)
- ISO 19650 glossary (standard terms)
- Glossary & acronym decoder (EN/AR)
- Information uses library
- All topic hubs
- Appointment process diagram
- Documents aligned with roles
- LOD / LOI / LOIN hub
- COBie practical guide
- Revit best practices
- Scan to BIM
- Infrastructure BIM & ISO 19650
- BIM dimensions (4D–7D, net zero)
- CDE deep guide
- BCF learning hub
- Façade BIM coordination
- Handover guide (PIM → AIM)
- BIM standards timeline
- BIM implementation best practices
- ISO 19650 references
- ISO/IEC 42001 references

6. Documents & delivery

- Project workflow
- Documents by stage

- Document workflow
- Roles by stage
- Role profiles
- Setup wizard
- Project data (enter once)
- Client standards
- Document generator
- BEP writer
- TIDP / MIDP / MPDT generator
- Risk register starter
- Clash test matrix (plan the tests)
- Meeting minutes (AI)
- Transmittals & letters
- Document review & compare
- File naming checker
- Naming & status code tool
- Suitability code hub
- Document guides
- ISO 19650 templates
- ISO/IEC 42001 templates
- Sample documents
- Downloads library

7. Models & coordination

- Revit project check
- QA/QC model checker
- IFC Hub (explore a model)
- COBie data checker
- IDS builder
- BCF studio
- Autodesk ACC / BIM 360
- Speckle

8. AI

- EIR writer
- EIR ↔ BEP compliance
- Model QA from IDS (AI + BCF)
- Clash triage (sort the results)
- Drawing & sheet QA
- ISO 19650 audit
- Project agent
- TIDP / MIDP from programme
- Connect AI to Revit, AutoCAD, Navisworks & Civil 3D
- Connect AI to BIM tools (MCP)
- Connect via MCP (setup tool)
- ISO/IEC 42001 learning hub
- Clauses 4–10
- Annex A controls
- AI in BIM
- ISO/IEC 42001 glossary

9. Resources

- BIM fee estimator
- Embodied carbon (6D)
- BIM maturity assessment
- Digital twin readiness
- Scan-to-BIM readiness
- BIM & ISO 19650 news
- My talent profile
- Talent pool (recruiters)

10. My work

- Home
- Platform guide
- My Day
- Portfolio

11. Account & settings

- My profile
- Help & support
- Plans & pricing
- About the portal

12. Document template library

13. Frequently asked questions

1. Getting started

The portal supports the whole ISO 19650 information management process — from the appointing party's requirements to handover — and an ISO/IEC 42001 AI management system. Each page explains itself through the **Guide** button at the top right; this book collects those guides in one place, in the same order as the sidebar.

How the platform is organised

Sidebar section	What it is for	Start with
ISO standards & learning	The standards themselves, explained from beginner to expert, with in-depth topic hubs, practice and references. Everything here works without a project or AI.	Learning paths by role
Documents & delivery	Tools to understand, write and check ISO 19650 documents without needing a project. Each document is explained, generated from your project data and checked before you issue it.	Project workflow
Models & coordination	Checks you run on model files and the issue tools you coordinate with. Files are checked in the page; you do not need a project to try them.	Revit project check
AI	The AI studio: tools that write and check information for you, each showing its sources and a result you can edit. It also covers connecting AI to authoring software and governing AI under ISO/IEC 42001.	EIR writer
Resources	Calculators for fees, carbon and readiness, plus client standards, news and careers. Use them for proposals, assessments and keeping up to date.	BIM maturity assessment
My work	Your own starting point: today's work, recent pages and your projects in one place. Nothing here needs setting up except a saved delivery plan for My Day.	Home
Projects	The records of one real project: its CDE, documents, delivery plan, issues, team and gates, shared with everyone you invite. Pick the project at the top of the section; every page below opens inside it.	Summary

Your first day

#	Step	Why	Page	Done when
1	Read the Start here tab of this guide	Two minutes on the sidebar saves an hour of searching later.	Platform guide	You know what search, Favourites, View by role and the sections do.
2	Set your role	Your role adds the tools you use most to Favourites and lets you filter the menu.	Home	Your role shows in the account menu and Favourites is no longer empty.
3	Enter Project data once	Every generator, the naming checker and the Revit check reuse it, so you never type the project code twice.	Project data (enter once)	Project code, name, parties and naming fields are filled in.

#	Step	Why	Page	Done when
4	Create a project	A project holds your CDE, documents, delivery plan, issues and team on the server.	Home	The project appears in the Projects section and its summary opens.
5	Open the project workflow	The ten stages show what happens when, who does it and which documents each stage needs.	Project workflow	You have clicked through the ten stages and know which one your project is in.
6	Read the document guide for the EIR	The EIR drives the BEP, the plans and the checks; the guide explains every section and how to check it.	Document guides	You know who writes the EIR, what goes in each section and what to check.
7	Try the file naming checker	Naming errors are the most common reason information is rejected, and the cheapest to fix.	File naming checker	You have pasted a list of file names and read the results.
8	Save a delivery plan	My Day, the Today card on Home and the naming checker read the TIDP or MIDP saved by the generator.	TIDP / MIDP / MPDT generator	A TIDP or MIDP is saved and My Day shows what is due.
9	Open the six ISO 19650 parts	Each part has an overview, clauses, examples and a quiz; Part 1 and Part 2 cover most daily work.	All parts (1–6): learning hub	You have read the Part 1 overview.
10	Pin your favourites	Pin the pages you will use every week so they sit at the top of the sidebar.	Home	At least three pages you use are in Favourites.

Your first week

Day	Theme	Focus	Pages
1	Orientation	Learn the layout, set your role, enter project data and create a project.	Platform guide, Project workflow, Project data (enter once), Part 1
2	Requirements	Understand the EIR and how a client sets requirements, then draft one.	Document guides, Appointment process diagram, EIR writer, ISO 19650 templates
3	Planning and naming	Build a delivery plan, check names against it and see what is due.	TIDP / MIDP / MPDT generator, Naming & status code tool, File naming checker, My Day
4	Models and coordination	Check a model, write requirements as IDS and manage issues as BCF.	Revit project check, IFC Hub (explore a model), IDS builder, BCF studio
5	Quality and your route	Review a document, look at your project's quality hub and choose your learning path.	Document review & compare, Quality hub, Quizzes, mock exam, scenarios, Learning paths by role

Common rules on every page

- Fields marked * are mandatory; the page will not save or generate until they are filled.
- Most project pages need a project: open one from Projects, or create one with the setup wizard.

- AI output is decision support. It must be reviewed by the accountable person before it is issued or relied on.
- Every page has an English and an Arabic interface (Account → Language) and a light or dark theme; the theme colour is set under Theme colour in the account menu.
- Exports (Word, Excel, CSV, PDF, IFC/IDS/BCF) are generated in the browser or by the server on demand; uploaded files are kept only where the page says so.

2. How the pieces connect

Enter once, reuse everywhere

Project data you type once fills every document, and the guides and review tools check what you produced.

Project data (enter once) → Document generator → ISO 19650 templates → Document guides → Document review & compare

- Project data (enter once) — Code, parties, naming fields
- Document generator — Draft EIR, BEP and more
- ISO 19650 templates — Or fill a template
- Document guides — Check each section
- Document review & compare — Review and compare

From delivery plan to your day

The TIDP or MIDP saved by the generator drives My Day, the Today card on Home and the naming and sheet checks.

TIDP / MIDP / MPDT generator → My Day → Home → File naming checker → Drawing & sheet QA

- TIDP / MIDP / MPDT generator — Save a TIDP or MIDP
- My Day — What is due and overdue
- Home — Today card
- File naming checker — Names checked against the plan
- Drawing & sheet QA — Title blocks against the plan

From model check to project issues

Check a model, turn requirements into IDS, and send failures as BCF issues into the project.

Revit project check → IDS builder → Model QA from IDS (AI + BCF) → BCF studio → Issues (BCF)

- Revit project check — Model health
- IDS builder — Requirements as IDS
- Model QA from IDS (AI + BCF) — IFC checked against IDS
- BCF studio — Issues as BCF
- Issues (BCF) — Tracked in the project

From clash report to meeting minutes

Set the clash rules, group the results by root cause, assign them as BCF and close them in the coordination meeting.

Clash test matrix (plan the tests) → Clash triage (sort the results) → BCF studio → Issues (BCF) →

Meeting minutes (AI)

- Clash test matrix (plan the tests) — Pairs and tolerances
- Clash triage (sort the results) — Group by root cause
- BCF studio — Assign as BCF
- Issues (BCF) — Project issues
- Meeting minutes (AI) — Minutes and actions

From EIR to a compliant BEP

The client's requirements become a BEP that answers them point by point, checked requirement by requirement.

EIR writer → BEP writer → EIR ↔ BEP compliance → Requirements traceability

- EIR writer — EIR from a brief
- BEP writer — BEP that answers it
- EIR ↔ BEP compliance — Gaps and wording
- Requirements traceability — Traced to delivery

From the standard to your learning route

Read the parts, go deeper in the topic hubs, test yourself and follow the path for your role.

All parts (1–6): learning hub → All topic hubs → Quizzes, mock exam, scenarios → Learning paths by role

- All parts (1–6): learning hub — Parts 1 to 6
- All topic hubs — In-depth topics
- Quizzes, mock exam, scenarios — Quizzes and mock exam
- Learning paths by role — Route for your role

3. Routes by role

BIM modeller

Model to the agreed level of information need, name files correctly and share clean, checked models.

First pages: File naming checker · Revit project check · LOD / LOI / LOIN hub · BCF studio

BIM coordinator

Federate models, run clash and model checks and manage issues through to the coordination meeting.

First pages: Clash test matrix (plan the tests) · IFC Hub (explore a model) · IDS builder · Clash triage (sort the results)

BIM manager / information manager

Write and maintain the BEP and delivery plans, run the CDE and keep the project compliant.

First pages: Project data (enter once) · BEP writer · TIDP / MIDP / MPDT generator · Quality hub

Client / appointing party

Set clear requirements, appoint the delivery team and accept the information you receive.

First pages: EIR writer · Appointment process diagram · EIR ↔ BEP compliance · Handover

AI governance lead

Run an ISO/IEC 42001 AI management system for how your organization uses AI in BIM.

First pages: ISO/IEC 42001 learning hub · Clauses 4–10 · Annex A controls · ISO/IEC 42001 templates

4. Project workspace

Purpose. The records of one real project: its CDE, documents, delivery plan, issues, team and gates, shared with everyone you invite. Pick the project at the top of the section; every page below opens inside it.

When to use it. Once you have created a project and want to store information your team works on together.

Start with: Summary. The groups follow the ISO 19650-2 sequence: appoint and plan, produce and share information in the CDE, coordinate models, then control quality and hand over. Team pages sit last because you set them up once.

Overview

The project summary, the activity log and the two AI helpers that answer from the project's own records.

Summary

The project's home page. It shows the project details, the team and the latest activity, with shortcuts to the main work areas.

How to use

1. Check the About card: description, Code, Appointing party, Location, Stage and Created date.
2. Use the shortcut buttons "Documents", "Files", "Delivery", "Model & coordination" and "Quality" to jump to those areas.
3. Review the Team card to see each member and their role (viewer, editor, manager or owner).
4. Click "Manage" on the Team card to add or remove members.
5. Read Recent activity for the six latest changes and click an entry to open the item it refers to.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Project details are changed in the project settings, which only managers can open.

Activity

A log of what happened in the project: uploads, state changes, generated documents, approvals and other edits, newest first.

How to use

1. Open the page to see the latest 100 entries, newest at the top.

2. Read each line: who did it, what was done and when.
3. Click an underlined summary to open the document, file or page it refers to.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Only the latest 100 entries are listed.
- Manager overrides of failed validation are recorded here with their reason.

Process gates (every stage)

The stage-by-stage process for the project's standards (ISO 19650 and, if selected, ISO/IEC 42001). Track each activity, create the documents it needs and approve the gate at the end of each stage.

How to use

1. Click a stage card in the process map to open that stage; the current stage opens automatically.
2. Click an activity's status button to cycle it "To do" → "In progress" → "Done" (editors and managers).
3. Click a "+ <code>" button in the Documents column to create the controlled document that activity needs.
4. When every activity in the stage is Done, a manager clicks "Approve gate" and can add an optional approval note.
5. Click "Revoke" (managers) to reopen an approved gate.
6. Click "Print status report" to print all stages with their status.

Outputs

- Gate approval record (approver name, date and note)
- Notification to project members when a gate is approved
- Activity log entry
- Printed status report

Mandatory inputs

- All activities in the stage marked Done (before "Approve gate" can be clicked)

Tips

- Only managers can approve or revoke gates; viewers can only read.
- Activities of an approved stage are locked until the gate is revoked.

Project assistant (AI)

An AI chat that answers questions from this project's records: documents, MIDP, issues, risks, reviews, meetings and requirements. Each answer lists numbered sources you can open.

How to use

1. Click one of the suggested questions, or type your own in the "Ask about this project..." box.

2. Press Enter or click "Ask" (Shift+Enter adds a new line).
3. Read the answer and click a numbered source to open the record it came from.
4. Ask follow-up questions in the same chat; recent turns are sent as context.
5. Click "New chat" to clear the conversation and start again.

Outputs

- Answer with numbered links to the project records it used

Mandatory inputs

- A question (not empty)

Tips

- The assistant only works when the server has a Claude API key configured.
- The chat is kept in your browser session only; it is not saved to the project.
- Check key facts in the cited sources before you rely on them.

Research notebook (AI)

Research notebooks for summarising, comparing or checking a set of sources with AI. Sources can be pasted text, project documents or PDF and text files from the project files. Answers cite the sources and are saved as notes.

How to use

1. Type a title in "Notebook title, e.g. Compare client EIRs" and click "New notebook" (editors), or open an existing notebook card.
2. Add sources with "Add a project document" or "Add a project file (PDF or text)".
3. Or type a "Source name", paste the text below it and click "Add text source".
4. Type a question, e.g. a comparison of handover requirements, and click "Ask".
5. Read the saved note; citations such as [N1] point to the numbered sources.
6. Use ✕ to remove a source or a note, and "← All notebooks" to go back to the list.

Outputs

- Saved notes: each question with its AI answer and source citations

Mandatory inputs

- Notebook title (to create a notebook)
- At least one source (before "Ask" is enabled)
- Question (at least 3 characters)
- Text source: a source name and at least 20 characters of text

Tips

- A notebook holds up to 20 sources.
- Only PDF, .txt, .md and .csv project files can be added as sources.

Appointment & planning

Everything agreed before production starts: appointment review, information uses, teams, responsibilities, level of information need and the MIDP/TIDP.

Information uses

Choose why information is produced on this project (ISO 19650-1 §5.1). The selected uses, with priority and responsible task teams, become the Information Uses Schedule referenced by the EIR and BEP.

How to use

1. Filter the list with "Search uses..." or a phase button ("All phases", Plan, Design, Construct, Operate).
2. Click a use's name to read its value, inputs, deliverables and information need.
3. Tick the checkbox of each use the project needs.
4. For each selected use, set the Priority (High, Medium or Low), click the responsible task team chips and add Notes.
5. Click "Save".
6. Click "Generate schedule" to create the Information Uses Schedule document, or "CSV" to export the selection.

Outputs

- Information Uses Schedule (controlled document in WIP, opened in the editor)
- CSV export of the selected uses

Mandatory inputs

- At least one information use selected (to generate the schedule)

Tips

- Task team chips appear only after task teams are added under Teams & milestones.
- "Generate schedule" saves unsaved changes first.
- Selecting uses needs the editor or manager role.

Teams & milestones

Set up the task teams and the information delivery milestones. Each task team produces its own TIDP, and its originator and role codes drive container names. Milestones are the key decision points from the EIR (ISO 19650-2 5.1.3).

How to use

1. Under Task teams, type the "Team name", and optionally the Organization and "Originator code (3–6)".
2. Choose the role code and, optionally, a "Team lead" from the project members.
3. Click "+ Add task team".
4. Under Information delivery milestones, type the milestone name, pick its date and optionally add the "Purpose / decision".
5. Click "+ Add milestone".
6. Use ✕ on a row to delete a team or a milestone.

Outputs

- Task teams and milestones used by the MIDP, TIDP, responsibility matrix, LOIN and MRM

Mandatory inputs

- Team name
- Originator code, if given (3–6 letters or digits)

- Milestone name
- Milestone date

Tips

- A task team that still has TIDP entries cannot be deleted; reassign or delete its containers first.
- Deleting a milestone keeps the containers and LOIN entries but clears their milestone.
- Adding or deleting needs the editor or manager role.

Responsibility matrix

The responsibility matrix (RACI) shows, for each information item or activity, which task team is Responsible, Accountable, Consulted or Informed (ISO 19650-2 5.4.2).

How to use

1. Type the "Information / element" and, optionally, the "Stage / milestone", then click "+ Add row".
2. On an empty matrix, click "Seed from MIDP" to add one row per planned container, or "Add ISO 19650-2 activity list" for a starter list.
3. Click a cell under a task team to cycle R → A → C → I → R/A.
4. Fix the rows flagged below the matrix: no accountable party, more than one accountable party, or no responsible party.
5. Click "Generate DRM document" to create the responsibility matrix document.

Outputs

- Responsibility matrix (DRM) controlled document in WIP, opened in the editor

Mandatory inputs

- At least one task team (added under Teams & milestones)
- Information / element for each row
- Exactly one A and at least one R per row

Tips

- Rows that break the RACI rules are highlighted in the table.
- Generating again updates the existing WIP document instead of creating a new one.
- Editing needs the editor or manager role.

Level of information need

Define the level of information need per element and milestone (ISO 7817-1): geometrical information, alphanumerical information and documentation. Reference these entries in the planner and the EIR.

How to use

1. Check the reference in the first field; it is filled in as the next LOIN number (e.g. LOIN-01).
2. Type the "Element" and, optionally, the "IFC class" and "Purpose".
3. Choose the milestone it applies to.
4. Describe the Geometry, Alphanumeric (properties) and Documentation requirements.
5. Click "+ Add LOIN".

6. Edit any text cell in the table directly; it saves when you leave the cell. Use ✕ to delete a row.

Outputs

- LOIN entries that can be referenced from containers in the delivery plan

Mandatory inputs

- Ref (not empty)
- Element

Tips

- Use the IFC class (e.g. IfcDoor) so the entry matches model elements.
- Adding and editing needs the editor or manager role.

Model responsibility (MRM)

The model responsibility matrix records, for each model element and milestone, which task team models it and at what level of development (LOD). LOD should never go down between milestones.

How to use

1. On an empty matrix, click "Add starter element list" to load a standard set of elements.
2. Or type the Discipline, optionally the System, and the "Element", then click "+ Add element".
3. In each milestone column, choose the task team and the LOD; hover an LOD to see its meaning.
4. Use "All disciplines" to filter the rows by discipline.
5. Review the warnings below the matrix and fix them.
6. Click "CSV" to export the matrix, or "Generate MRM document" to create the MRM document.

Outputs

- MRM controlled document in WIP, opened in the editor
- CSV export of the matrix

Mandatory inputs

- At least one task team and one milestone (added under Teams & milestones)
- Discipline
- Element

Tips

- The starter list can only be added while the matrix is empty.
- Adding, editing and generating need the editor or manager role; anyone can export the CSV.

MIDP / TIDP planner

The project's delivery plan: every information container each task team will deliver, at which data exchange (milestone), in which formats and by when. It is the project's TIDPs and MIDP in one place, checked continuously, and exports in the MIDP / TIDP template layout.

How to use

1. Set up task teams (with originator codes) and milestones first under "Teams & milestones": milestones are the data exchanges of the MIDP.
2. Click "+ Container" and fill in the task team, title, type, container name ("Auto" gives the next free number), milestone, dates and the template columns: description, native format, exchange formats, model reference (for drawings and schedules cut from a model), classification and cost code.

3. To deliver the same container again at a later exchange, click "+ Exchange" on its row: it is copied to the next milestone it is not planned for, depending on the earlier issue.
4. Or click "Import (template / Excel)" and upload a filled MIDP / TIDP workbook (.xlsx): task teams and exchanges are matched to the project's, missing ones are created, and each exchange becomes one row per container. Pasting rows from Excel still works.
5. Use the filter to switch between the MIDP (all task teams) and one team's TIDP, and between the table and the Gantt view; update the status of each row as work moves through the CDE.
6. Fix what the plan check reports (duplicates at the same exchange, dates after the milestone, missing names, dependency loops); the full list is in the Quality hub.
7. Click "⬇ Excel" for the MIDP / TIDP workbook, or "Generate MIDP" / "Generate TIDP" for the controlled Word documents.

Outputs

- MIDP / TIDP workbook (.xlsx) in the template layout: document control, instructions, the MIDP and one TIDP sheet per task team, grouped as Models / Documents, schedules & reports / Drawings / Others, with naming fields, revision and status codes and owner / planned / issued dates per data exchange; plus Tracking, Milestones and Summary sheets
- MIDP and TIDP controlled documents (WIP, ready to review and issue)
- CSV export of the current view
- Plan findings in the Quality hub

Mandatory inputs

- At least one task team (set up under Teams & milestones)
- Task team and title for every container
- Editor role or higher to add, import or change containers

Tips

- Plan a container once per data exchange: the same name at two milestones is expected, twice at the same milestone is reported as a duplicate.
- Revision and status codes in the workbook come from the file linked to the container in the CDE.
- The TIDP sheets are what the lead appointed party checks before consolidating; ask each task team to work in its own sheet when filling the template outside the platform.

Appointment review (AI)

AI review of an appointment, contract or BIM specification for ISO 19650 information-management obligations, such as the information protocol, EIR, BEP, MIDP/TIDP, CDE, IP and licence, liability, security and handover. It is a checklist aid, not legal advice.

How to use

1. Choose a PDF or .txt file, or paste the contract text into "Paste contract text...".
2. Click "Review document" and wait (it can take up to a minute).
3. Read the Summary.

4. Check the table: each Obligation is marked present, partial or missing, with Evidence and a Recommendation.
5. Pass the "Points for legal review" to your legal adviser.

Outputs

- On-screen review: summary, obligation checklist with status, evidence and recommendations, and points for legal review

Mandatory inputs

- A PDF or .txt file (up to 25 MB), or pasted text (at least 200 characters)

Tips

- The result is not saved; copy what you need before leaving the page.
- Running a review needs the editor or manager role.

Information (CDE)

The common data environment: controlled documents with reviews and revisions, and files moving through WIP, Shared, Published and Archived.

Documents

The register of controlled documents (EIR, BEP, MIDP, policies and others) created from the template library, with their revision, CDE status, review state and author.

How to use

1. Find a document with "Search documents..." or filter by state with "All states" (WIP, SHARED, PUBLISHED, ARCHIVED).
2. Click "+ New document" (editors and managers).
3. Choose the Template and, if offered, a house template under "Start from".
4. Optionally type a Title, and edit the "Container name / document number" (replace XXX with your originator code).
5. Click "Create document"; the new document opens in the editor.
6. Click any row to open a document; WIP documents show "Edit" for editors.

Outputs

- New controlled document in WIP, filled in with the project details

Mandatory inputs

- Template

Tips

- Documents such as the MIDP or the responsibility matrix are generated from their data page; the dialog then shows "Open ..." and "Generate ... now" instead of "Create document".
- A comment badge on a row shows the number of open comments.

Files

The project's CDE file store, organised in folders by state: WIP, Shared, Published and Archived. Upload any format, keep version history, set the container name, status, suitability and revision, and comment on files.

How to use

1. Choose a folder in the Folders tree; click "+ Folder" to create a subfolder inside it.
2. Click "Upload files" or drag files onto the folder area.
3. Click a file to open its details and set the Container name, CDE state, Suitability and Revision, or use "Move to folder".
4. Click "Upload new version" to add a new version of the selected file; download any version with ⬇.
5. For IFC or COBie files, click "Validate now" or open the validation results.
6. Add comments to the file in the Comments section.

Outputs

- Stored file with version history
- Notification to the other project members on upload and on state change
- Automatic validation of .ifc files and COBie .xlsx files
- Activity log entries

Mandatory inputs

- A selected folder
- At least one file to upload

Tips

- Only managers can set PUBLISHED or ARCHIVED, delete files or delete empty folders.
- A file whose latest version failed validation cannot leave WIP; a manager can override with a reason that is logged.
- Viewers can browse, download and comment but cannot upload or edit.

Model & coordination

Model validation, QA/QC reviews, BCF issues, the clash matrix, 4D planning and asset tags.

Model validation

Checks IFC models and COBie workbooks stored in the project Files. Each check gives a PASS, PASS with warnings, FAIL or ERROR result and a score, measured against generic rules plus the project's LOIN rows and uploaded IDS files.

How to use

1. Upload an .ifc model or a COBie .xlsx (file name containing "COBie") in Files; if the list is empty, use 'Go to Files'.
2. Check the 'Requirement sources' card: LOIN rows with IFC classes and properties, and uploaded .ids files, become extra checks.
3. Click 'Validate' next to a file to run the checks again (new versions are checked automatically).

4. Click 'Report' to open the result: summary figures, each check, LOIN & IDS requirements and the findings list.
5. In the report, click '⬇ CSV' to export the findings, or 'Raise issues for errors' to create one issue per error.

Outputs

- Validation report with status (PASS / PASS with warnings / FAIL / ERROR) and score per file version
- Findings CSV export
- Error issues in Issues (BCF), linked to the file and the validation report

Mandatory inputs

- An IFC model (.ifc) or COBie workbook (.xlsx with "COBie" in the name) uploaded to Files

Tips

- A failing version cannot be shared until it is fixed; managers can override with a reason.
- A result marked "re-run" was made for an older version of the file.
- Validating and raising issues need the editor role or higher.

Model QA/QC reviews

Graded QA/QC checklists for discipline models before information is shared (ISO 19650-2 §5.6.3). Each check is graded A–D or N/A, weighted by priority, and the review gets a score and an overall grade.

How to use

1. Under 'New review', enter the model / review title, choose the discipline, and optionally a task team and milestone / stage.
2. Click 'Start review' to open the checklist for that discipline.
3. Grade every check A, B, C, D or N/A and add a 'Comment / evidence' where useful; changes save automatically.
4. Click 'Raise issues for C/D' to create an issue for each check graded C or D.
5. Click 'Complete review' once every check is graded; use 'Reopen' to make further changes.
6. Click '⬇ CSV' to export the checklist with grades and comments.

Outputs

- Numbered review (QA-001, QA-002…) with weighted score and grade A–D
- Checklist CSV export
- Issues for checks graded C or D, assigned to the reviewed task team

Mandatory inputs

- Review title (must not be empty)
- Discipline (one of the listed disciplines)
- A grade for every check before 'Complete review' is enabled (use N/A where not applicable)

Tips

- A critical check graded D caps the whole review at D.
- Grades: A from 90%, B from 75%, C from 50%, otherwise D.
- Starting and grading need the editor role; only managers can delete a review.

Issues (BCF)

The project issue register for issues, clashes, RFIs and comments. Issues can be raised by hand, from validation reports, QA/QC reviews and clash reports, and exchanged with other tools as BCF.

How to use

1. Click '+ Issue', enter a title, and optionally a description, type, priority, due date, assignee and task team, then click 'Raise issue'.
2. Use the search box, the status and type filters and 'Assigned to me' to find issues.
3. Click an issue to open it, change its status, priority, assignee, due date, type or task team, and reply under 'Discussion'.
4. Click '⬇ BCF' to download all issues as a BCF file, or '⬆ Import BCF' to load a .bcf / .bcfzip file.
5. When open clashes exist, click '✨ AI triage clashes' to review suggested changes and apply the ones you accept.
6. Click '⬇ CSV' to export the filtered list.

Outputs

- Numbered issue records with status history and comments
- BCF export (.bcfzip)
- CSV export of the filtered issue list
- Notifications to the assignee and to the issue creator on status changes

Mandatory inputs

- Title (must not be empty)
- For import: a .bcf, .bcfzip or .zip BCF file

Tips

- Viewers can raise issues and update the ones they raised or are assigned to.
- Importing BCF and AI triage need the editor role; importing the same BCF again updates existing issues instead of duplicating them.
- Overdue issues are highlighted and counted next to the filters.

Clash matrix

A clash detection matrix between the project's task teams. Each cell defines a clash test (type, tolerance, priority, frequency, search sets), and clash reports from Navisworks, Solibri or Revizto can be imported as Clash issues.

How to use

1. Make sure task teams exist (Delivery plan → Task teams); the matrix lists them in rows and columns.
2. Click a cell ('+') to define the test for that pair of teams.
3. Set 'Type', 'Tolerance (mm)', 'Priority', 'Frequency', 'Test code', search sets for side A and B and 'Notes / rules', then click 'Save'.
4. Click '⬆ Import clash report', choose a CSV file or paste the report, set 'Test name', 'Assign to', 'Responsible task team' and grouping, then click 'Import'.
5. Click '⬇ Clash tests CSV' to export the test definitions.

Outputs

- Clash test definitions per task-team pair
- Clash tests CSV export
- Clash issues in Issues (BCF), grouped by grid location or one per clash, with a notification to the assignee

Mandatory inputs

- At least one task team in the delivery plan
- For import: a clash report with a header row and at least one clash row (CSV/TSV)

Tips

- Resolved and approved clashes in the report are skipped.
- Defining tests and importing reports need the editor role.

4D planning

Links programme activities to an IFC model by storey and IFC class. Move through time to compare what should be built (planned) with what has been built (actual), and see elements no activity covers.

How to use

1. Under 'Model', choose an IFC file from the project files; the portal reads its elements by storey and class.
2. Click '+ Activity', or 'Paste from programme' and then 'Add rows', to add activities with code, name, start and finish dates.
3. For each activity, add storeys and IFC classes (none means all), and fill actual start and finish as work progresses.
4. Click 'Save' to store the plan.
5. Switch between 'Planned' and 'Actual' and move the date or timeline slider to see progress in the storey × class grid.
6. Click '⬇ CSV' to export the activities, or 'Refresh from latest version' after the model is updated.

Outputs

- Saved 4D plan linked to the model version
- Planned and actual percent complete for any date
- Warnings for elements not covered by any activity and for overlapping activities
- Activities CSV export

Mandatory inputs

- An IFC file uploaded to Files and chosen under 'Model'
- Activity name for every activity (must not be empty)
- Dates in YYYY-MM-DD format

Tips

- Pasted rows use the columns Code, Activity, Start, Finish, Storeys, Classes; separate storeys and classes with ";".
- Choosing the model and editing activities need the editor role.

Asset tags

Builds asset tags and checks lists of tags against the project's client standard, or against the generic location + equipment format when no client standard is applied.

How to use

1. Read the note at the top to see which tag format is used (client standard or generic).
2. Under 'Build a tag', fill the 'Location tag' and 'Equipment tag' parts; suggested codes appear where the standard lists them.
3. Check the result: the page shows the tag, any errors, or 'Valid tag', then click 'Copy tag'.
4. Under 'Check a list of tags', paste one tag per line (for example a COBie TagNumber column).
5. Review the valid and invalid counts and duplicate warning, and click '⬇ CSV' to export the results.

Outputs

- A tag string copied to the clipboard
- Tag check results CSV (tag and result for each line)

Mandatory inputs

Nothing is mandatory.

Tips

- A manager applies the client standard in Project settings under 'Client standard'.
- Full tags and equipment-only tags are both accepted in the list check.

Control & handover

Quality checks, requirements traceability, stage gates, risks, health and safety information and the PIM to AIM handover.

Quality hub

Runs automated checks against ISO 19650-2 and ISO/IEC 42001 expectations: required document set, document completeness, placeholders, naming, plan dates and dependencies. Shows an overall score, a delivery plan score and daily trends.

How to use

1. Open the page; the checks run automatically and show the overall and delivery plan scores with error, warning and suggestion counts.
2. Review the 'Document set' and 'Delivery plan' findings; use 'Open planner' to fix plan issues.
3. Under 'Documents', click a row to see its findings, or 'Open →' to edit the document.
4. Click '↻ Re-run' after making changes.
5. Click '📦 Audit evidence pack' or '⬇ CSV' to download the results, and use 'Trends' to follow scores over time.

Outputs

- Overall quality score and delivery plan score

Mandatory inputs

Nothing is mandatory.

- Quality report CSV (source, severity, area, reference, finding, clause)
- Audit evidence pack (.zip): every document in Word, the quality report and all registers, indexed by ISO clause
- Trends CSV with one snapshot per day

Tips

- Archived documents are not checked.
- Trends build up as the portal records one snapshot each day.

Requirements traceability

Traces each requirement from the EIR/AIR to the BEP response and the MIDP containers that deliver it. Coverage (Delivered, Planned, Response only, Not addressed) updates automatically as containers are shared or published.

How to use

1. Click '+ Paste requirements' to paste one requirement per line (or Ref, Requirement, Category from Excel), or '✨ Extract from document text' to let the AI split pasted text.
2. Set the 'Source' (for example EIR), then click 'Preview'.
3. Check the preview and click 'Add … requirements'.
4. For each requirement, write the BEP response and use '+ link container…' to link MIDP containers.
5. Click a coverage card to filter, and '⬇ CSV' to export the traceability matrix.

Outputs

- Requirement register with references (REQ-001…), BEP responses and linked containers
- Coverage status per requirement
- Traceability CSV export

Mandatory inputs

- Requirement text (pasted or extracted; 'Preview' stays disabled while the box is empty)

Tips

- Containers can only be linked once deliverables exist in the delivery plan.
- Adding, editing and deleting requirements need the editor role.

Risk register

The information delivery risk register required by ISO 19650-2 5.3.6. Each risk has a likelihood × impact score, mitigation, residual score, owner and review date, shown in a heat map of open risks.

How to use

1. Click '+ Risk' to open a new risk.
2. Enter the risk, category, owner, 'Likelihood (1–5)', 'Impact (1–5)', cause and 'Mitigation / treatment'.
3. Optionally set residual likelihood and impact, status and 'Next review', then click 'Save'.

4. Click a heat map cell to filter the list; click a row to edit a risk.
5. Click '📄 Generate register document' for a controlled register document, or '⬇ CSV' to export.

Outputs

- Risk records (R01, R02…) with score and residual score
- Risk register document generated in Documents
- Risk register CSV export

Mandatory inputs

- Risk title (must not be empty; 'Save' stays disabled until entered)
- Likelihood and impact (whole numbers 1–5; default 3)

Tips

- Scores of 15 or more count as high risks.
- Risks past their review date are highlighted; the Risk review reminder automation can chase owners.
- Adding and editing need the editor role; only managers can delete a risk.

Health & safety information

The health and safety information register (ISO 19650-6). It records hazards and residual risks so the information reaches the people who build, operate, maintain and demolish the asset.

How to use

1. Click '+ H&S item'.
2. Enter the hazard, location, 'Lifecycle phase', 'Residual risk', status and owner.
3. Link the supporting 'Information container' from the project files.
4. Describe the hazard, the 'Control measures' and who it is 'Shared with', then click 'Save'.
5. Use the phase buttons to filter the list and '⬇ CSV' to export the register.

Outputs

- H&S records (HS01, HS02…) with phase, residual risk and linked information container
- H&S register CSV export
- Notification to the owner when a new item is assigned to them

Mandatory inputs

- Hazard (must not be empty; 'Save' stays disabled until entered)

Tips

- The summary counts items without linked information, so you can close the gaps.
- Adding and editing need the editor role; only managers can delete an item.

Handover

The PIM → AIM transfer checklist (ISO 19650-2 5.7–5.8, ISO 19650-3). A standard checklist is created on first use, and readiness shows the percentage of applicable items complete.

How to use

1. Review the checklist items grouped by category, with their ISO clause.

2. Set each item's status: Not started, In progress, Complete or N/A.
3. Choose an owner and link an evidence file from the CDE; use '⬇' to download linked evidence.
4. To add a project-specific item, choose a category, type the item and click '+ Add item'.
5. Track 'Handover readiness' until all applicable items are complete.

Outputs

- Handover readiness percentage
- Checklist with owner and linked evidence file per item

Mandatory inputs

- Item title when adding an item (must not be empty)

Tips

- Items set to N/A are left out of the readiness percentage.
- Changing items needs the editor role.

Team

Meetings and progress reports, automations, team training, members and project settings.

Meetings & progress report

Kick-off, coordination, progress and model review meetings with standing agendas. Open actions carry forward to the next meeting of the same type, and minutes and the progress report are generated as controlled documents.

How to use

1. Under 'New meeting', choose the meeting type, enter a title and date, then click 'Create with standard agenda'.
2. In the meeting, set 'Date & time', 'Location / link' and attendees (add external attendees by typing a name and pressing Enter).
3. Write 'Minutes / decisions' for each agenda item; use '+ Agenda item' to add more.
4. Add actions with '+ Action', each with an owner, due date and status; changes save automatically.
5. Set the status (Planned, Held, Minutes issued) and click '📄 Generate minutes'.
6. On the meetings list, click '📊 Generate progress report' for a project progress report.

Outputs

- Meeting records with agenda, minutes and actions
- Minutes document generated in Documents (WIP, P01.01)
- Progress report document generated in Documents (WIP, P01.01)
- Open actions carried forward to the next meeting of the same type

Mandatory inputs

- Meeting title (must not be empty)
- Meeting type (one of BIM kick-off, BIM coordination, BIM progress, Information model review)

Tips

- The 'Open actions' list shows unfinished actions from the latest meeting of each type, with overdue ones highlighted.
- Creating and editing meetings needs the editor role; only managers can delete a meeting.

Automations

Scheduled background jobs that post notifications (and emails, if configured) to the right people: Overdue chaser, Quality review and Risk review reminder. Every run is logged.

How to use

1. Read each automation card to see what it does.
2. Tick the checkbox to switch an automation on or off.
3. Choose 'Daily' or 'Weekly' as the frequency.
4. Click 'Run now' to run it immediately.
5. Check 'Run history' for the date, trigger and summary of each run.

Outputs

- Notifications (and emails, if configured) to the people concerned
- Run history entry with a summary for each run

Mandatory inputs

Nothing is mandatory.

Tips

- Only managers can switch automations on or off, change frequency or click 'Run now'.
- Quality review sends managers the score, the change since the last run and the top problems.

Team training

A project manager assigns courses to team members and tracks completion, which comes from lesson progress. Supports capability and competence evidence (ISO 19650-2 5.3.3 / 5.5.2, ISO/IEC 42001 7.2).

How to use

1. Under 'Assign training', choose a 'Course'.
2. Tick one or more 'Team members'.
3. Optionally set a 'Due date', then click 'Assign'.
4. Follow progress per member in the table and the 'Completion' card; overdue assignments are highlighted.
5. Click '⬇ CSV' to export, or 'Remove' to cancel an assignment.

Outputs

- Course assignments with due date and progress
- Notification to each assigned member
- Training CSV export

Mandatory inputs

- Course
- At least one team member ('Assign' stays disabled until one is ticked)
- Due date, if given, in YYYY-MM-DD format

Tips

- Only managers can assign or remove training; members find their assigned courses in Learn.

Team

Lists the project members and pending invitations with their roles. Managers add members, change roles and remove members; anyone except the owner can leave the project.

How to use

1. Under 'Add member', enter the colleague's email.
2. Choose a role: Viewer (read & comment), Editor (create & edit) or Manager (approve, publish, manage team), then click 'Add'.
3. Change a member's role from the role list in the table.
4. Click 'Remove' to remove a member, 'Cancel' to cancel a pending invitation, or 'Leave' to leave the project yourself.

Outputs

- New member added, or an invitation that is accepted automatically when the person registers with that email
- Notification to the member when added or when their role changes

Mandatory inputs

- Email (valid email address)
- Role (viewer, editor or manager)

Tips

- Only managers see the 'Add member' form and can change roles or remove others.
- The owner's role cannot be changed and the owner cannot be removed.

Project settings

Edits the project details and standards in scope, and applies the client standard used for COBie checks and asset tags. Only project managers can open this page; only the owner can delete the project.

How to use

1. Edit the project name, code, appointing party, location, current stage and description.
2. Tick the standards in scope (ISO 19650, ISO/IEC 42001), then click 'Save changes'.
3. Under 'Client standard', choose a standard or 'None (generic checks)', choose a stage or 'Latest stage', then click 'Apply'.
4. Owner only: click 'Delete project' and type the project code to confirm.

Outputs

- Updated project details
- Client standard applied to COBie checks and asset tags

Mandatory inputs

- Project name (at least 2 characters)
- Project code (2–6 letters or digits)
- At least one standard in scope ('Save changes' stays disabled otherwise)

- To delete: the exact project code typed in the confirmation

Tips

- The project code is the first field of every container name.
- Deleting a project permanently removes all its documents, files, comments and history.
- Client standards are managed under Resources › Client standards.

5. ISO standards & learning

Purpose. The standards themselves, explained from beginner to expert, with in-depth topic hubs, practice and references. Everything here works without a project or AI.

When to use it. When you meet a term, clause or process you do not know, and for structured learning by role.

Start with: Learning paths by role. Start here gives you a route; then the six parts of ISO 19650, the essentials you look up daily, the in-depth topic hubs, ISO/IEC 42001 and finally the references.

Start here

Learning paths by role, best-practice guides, videos, the implementation guide and practice quizzes.

Best-practice guides

A short library of practical best-practice guides for modellers, coordinators and information managers. The guidance is original; check your project's information standard first.

How to use

1. Browse the guide cards; each shows a summary and who it is for.
2. Click a card to open the full guide.
3. Under a guide, click a related template badge to open that template in the Knowledge hub.
4. Click ← All guides to return to the list.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- The six guides cover model authoring, shared parameters, writing a BEP, coordination meetings, infrastructure projects and façade information.

Learning paths by role

Step-by-step learning plans for five roles: BIM modeller, BIM coordinator, BIM manager / information manager, client / appointing party and AI governance lead. Each step points to a platform page to read, practise, try a tool or take a quiz.

How to use

1. Pick a path card; each shows its weeks, number of steps, total time, related videos and your progress.
2. Read each step's purpose, its type (Read, Practise, Tool or Quiz) and its estimated minutes.

3. Click Open → to go to the page for that step; click a video thumbnail to play a related video on the page.
4. Tick Mark as done when you finish a step; the Continue button jumps to the next unfinished step.
5. Click Reset progress to clear the path and start again.

Outputs

- Step progress for each path saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- When every step is done, the page points you to the mock exams on the Learn page.
- Progress is kept per browser, so it does not follow you to another device.

Video library

A curated library of free, public YouTube videos on ISO 19650 and BIM information management, grouped by topic and level, including videos in Arabic.

How to use

1. Type in Search videos... to search titles, channels and summaries.
2. Filter by level (All levels, Beginner, Intermediate, Advanced) and by language (All languages, English, Arabic).
3. Click a topic chip to show only that topic; the number on each chip is how many videos match.
4. Click a video card to play it in a window, or click Watch on YouTube to open it on YouTube.
5. Click Mark as watched to track what you have seen; tick Show summaries in Arabic to switch the summary language.

Outputs

- Watched videos saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The Our videos tab at the top shows your organisation's own training videos.
- Videos are hosted by their owners on YouTube; the platform only links to them.

Our videos

Your organisation's own training videos, such as onboarding, project standards, software how-tos and lessons learned. Everyone signed in can watch them; only administrators can add, edit or delete videos.

How to use

1. Type in Search videos..., and click a topic chip to filter when more than one topic is in use.
2. Click a video card to play it; each play adds to its view count.
3. Administrators: click + Add a video, then choose Upload a file or YouTube or Vimeo link.

4. Fill in Title, Description, Topic and Language, then click Add video; a progress bar shows the upload.
5. Administrators: click Edit or Delete on a card to change a video's details or remove it.

Outputs

- Added videos, listed for everyone signed in (administrators only)

Mandatory inputs

- Video file (MP4, WebM, OGG or MOV) or a YouTube or Vimeo link (administrators only)
- Title (at least 2 characters; an uploaded file uses its file name if left blank)

Tips

- MP4 (H.264) plays in every browser.
- Only upload videos you have the right to share.

ISO 19650 adoption roadmap

A step-by-step plan for adopting ISO 19650 across your organisation (page heading: ISO 19650 implementation guide), in five phases: assess where you are, build the foundation, prepare people, pilot on a project, and roll out and improve.

How to use

1. Read each phase's goal and its steps; each step lists its outputs, and some have an Open link to the related page.
2. Set each step's status: To do, In progress, Done or N/A.
3. Enter an Owner, a due date and a Note for each step; changes save automatically.
4. Follow the percentage at the top; steps set to N/A are left out of the count.
5. Click ⬇ CSV to download the whole plan with status, owner, due date and notes.

Outputs

- Step status, owner, due date and notes saved to your account
- CSV file of the implementation plan

Mandatory inputs

Nothing is mandatory.

Tips

- Owner and Note are saved when you leave the field.

Quizzes, mock exam, scenarios

The main learning page: short courses, practice questions by topic, timed mock exams (all topics or one ISO 19650 part), decision scenarios and an AI interview coach. Quiz and exam answers are scored on the server and saved to your account.

How to use

1. Under Courses, click Start (or Continue) on a course, work through the lessons with ✔ Mark complete or Next lesson →, and end with Finish & practise questions →.

2. Under Practice by topic, click Practise next to a topic; pick an answer, click Check to see the explanation, then Next →, and click Finish after the last question.
3. Click Start mock exam for 30 questions across all topics in 40 minutes (pass mark 65%), or click Start next to a part under Mock exam by part (20 questions in 25 minutes; All parts: 30 questions in 40 minutes).
4. In an exam, watch the timer, move with ← Back and Next →, and click Finish; the exam submits itself when the time runs out.
5. Under Scenarios, click Play and choose an option at each decision; you get feedback and a score at the end.
6. In AI interview coach, choose a role and a level, click Start mock interview, then type each answer and click Answer.

Outputs

- Quiz and exam scores saved to your results history (Recent results)
- Skill profile by topic, built from all your attempts
- Course lesson completion saved to your account

Mandatory inputs

Nothing is mandatory.

Tips

- Exams give no feedback until you finish; the result shows Pass or Not yet, a score by topic and a review of every question.
- Only answered questions count towards the score, so answer every question before you click Finish.
- Courses a project manager assigns to you appear at the top under Assigned to you; Leave closes a quiz without saving it.

ISO 19650 parts

Parts 1 to 6, each from overview to clauses, examples, Q&A and a quiz, plus the 2026 revision status.

All parts (1–6): learning hub

The ISO 19650 learning hub. It shows how the six parts fit together, and opens a page for each part with explanations, clauses, practical examples, questions and answers, a quiz and an AI tutor.

How to use

1. Read How the six parts fit together: a diagram of the delivery and operational phases, with Part 1 as the foundation and Parts 4, 5 and 6 across both phases; click any part to open it.
2. Use Which part applies at each stage to see the main part (●) and the parts that also apply (○) at each stage.
3. Read How each part links to the others for the hand-offs between parts.
4. Under Open a part, click a part card; each card shows your compliance checklist progress for that part.

5. Click What is changing → on the red banner to read about the 2026 revision.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- For timed exams on each part, use Mock exam by part on the Learn page.

Part 1

Part 1 (ISO 19650-1:2018, Concepts and principles) sets the shared vocabulary, concepts and principles for managing information about built assets across their whole life. This page explains it at three levels, with 9 clauses, a 14-item compliance checklist, 5 practical examples, 10 questions and answers and a 6-question quiz.

How to use

1. Choose a tab: Overview, Clauses & checklist, Practical examples, Questions & answers, Quiz, Documents & mistakes or Ask AI.
2. On Overview, read In plain terms and Why it matters, then pick Beginner, Intermediate or Expert to change the depth of the explanation; key concepts and links to other parts follow.
3. On Clauses & checklist, read the key requirements, tick the compliance checklist items, and expand each clause in Deep dive — clause by clause.
4. On Practical examples, read the worked example and the project examples; Questions & answers has its own search box, and on Quiz each answer shows at once whether it is right and why (Start again resets it).
5. On Documents & mistakes, click Open template ↗ next to a key document and read the common mistakes and fixes; on Ask AI, ask the AI tutor about this part.
6. Use the Part 1–6 buttons at the top, or the ← Previous part and Next part → cards at the bottom, to move between parts on the same tab.

Outputs

- Checklist ticks, chosen level and latest quiz score saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- Key documents covered: OIR, AIR, EIR, the project information standard, the CDE workflow and procedure, and the information protocol.
- The red banner on Overview says what the 2026 draft revision changes for this part; the current edition stays in force until the new one is published.
- The content is paraphrased guidance, not the standard's text; verify against the licensed edition.

Part 2

Part 2 (ISO 19650-2:2018, Delivery phase of the assets) sets out the information management process for the delivery phase through eight activities, from assessment and need to project close-out. This

page explains it at three levels, with 9 clauses, an 18-item compliance checklist, 5 practical examples, 10 questions and answers and a 6-question quiz.

How to use

1. Choose a tab: Overview, Clauses & checklist, Practical examples, Questions & answers, Quiz, Documents & mistakes or Ask AI.
2. On Overview, read In plain terms and Why it matters, then pick Beginner, Intermediate or Expert to change the depth of the explanation; key concepts and links to other parts follow.
3. On Clauses & checklist, read the key requirements, tick the compliance checklist items, and expand each clause in Deep dive — clause by clause.
4. On Practical examples, read the worked example and the project examples; Questions & answers has its own search box, and on Quiz each answer shows at once whether it is right and why (Start again resets it).
5. On Documents & mistakes, click Open template ↗ next to a key document and read the common mistakes and fixes; on Ask AI, ask the AI tutor about this part.
6. Use the Part 1–6 buttons at the top, or the ← Previous part and Next part → cards at the bottom, to move between parts on the same tab.

Outputs

- Checklist ticks, chosen level and latest quiz score saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- Key documents covered: EIR, pre- and post-appointment BEP, capability and capacity assessment, detailed responsibility matrix, TIDP, MIDP and mobilisation plan.
- The red banner on Overview says what the 2026 draft revision changes for this part; the current edition stays in force until the new one is published.
- The content is paraphrased guidance, not the standard's text; verify against the licensed edition.

Part 3

Part 3 (ISO 19650-3:2020, Operational phase of the assets) sets out the information management process for the operational phase, so the AIM stays complete, current and trustworthy as the asset changes. This page explains it at three levels, with 8 clauses, a 15-item compliance checklist, 5 practical examples, 10 questions and answers and a 6-question quiz.

How to use

1. Choose a tab: Overview, Clauses & checklist, Practical examples, Questions & answers, Quiz, Documents & mistakes or Ask AI.
2. On Overview, read In plain terms and Why it matters, then pick Beginner, Intermediate or Expert to change the depth of the explanation; key concepts and links to other parts follow.
3. On Clauses & checklist, read the key requirements, tick the compliance checklist items, and expand each clause in Deep dive — clause by clause.
4. On Practical examples, read the worked example and the project examples; Questions & answers has its own search box, and on Quiz each answer shows at once whether it is right and why (Start

again resets it).

5. On Documents & mistakes, click Open template ↗ next to a key document and read the common mistakes and fixes; on Ask AI, ask the AI tutor about this part.
6. Use the Part 1–6 buttons at the top, or the ← Previous part and Next part → cards at the bottom, to move between parts on the same tab.

Outputs

- Checklist ticks, chosen level and latest quiz score saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- Key documents covered: OIR, AIR, EIR for the operational phase, the information handover strategy, the CDE workflow and procedure, and the information protocol.
- The red banner on Overview says what the 2026 draft revision changes for this part; the current edition stays in force until the new one is published.
- The content is paraphrased guidance, not the standard's text; verify against the licensed edition.

Part 4

Part 4 (ISO 19650-4:2022, Information exchange) details the process and criteria for each information exchange, so information moving between CDE states is reviewed consistently at sharing, authorisation and acceptance. This page explains it at three levels, with 9 clauses, a 14-item compliance checklist, 5 practical examples, 10 questions and answers and a 6-question quiz.

How to use

1. Choose a tab: Overview, Clauses & checklist, Practical examples, Questions & answers, Quiz, Documents & mistakes or Ask AI.
2. On Overview, read In plain terms and Why it matters, then pick Beginner, Intermediate or Expert to change the depth of the explanation; key concepts and links to other parts follow.
3. On Clauses & checklist, read the key requirements, tick the compliance checklist items, and expand each clause in Deep dive — clause by clause.
4. On Practical examples, read the worked example and the project examples; Questions & answers has its own search box, and on Quiz each answer shows at once whether it is right and why (Start again resets it).
5. On Documents & mistakes, click Open template ↗ next to a key document and read the common mistakes and fixes; on Ask AI, ask the AI tutor about this part.
6. Use the Part 1–6 buttons at the top, or the ← Previous part and Next part → cards at the bottom, to move between parts on the same tab.

Outputs

- Checklist ticks, chosen level and latest quiz score saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- Key documents covered: the CDE workflow and procedure, the information container QA checklist, the project information standard, the EIR and the model production and delivery table.
- The content is paraphrased guidance, not the standard's text; verify against the licensed edition.

Part 5

Part 5 (ISO 19650-5:2020, Security-minded approach to information management) sets a proportionate, security-minded approach to sensitive information about built assets, from sensitivity assessment to breach and incident management. This page explains it at three levels, with 7 clauses, a 16-item compliance checklist, 5 practical examples, 10 questions and answers and a 6-question quiz.

How to use

1. Choose a tab: Overview, Clauses & checklist, Practical examples, Questions & answers, Quiz, Documents & mistakes or Ask AI.
2. On Overview, read In plain terms and Why it matters, then pick Beginner, Intermediate or Expert to change the depth of the explanation; key concepts and links to other parts follow.
3. On Clauses & checklist, read the key requirements, tick the compliance checklist items, and expand each clause in Deep dive — clause by clause.
4. On Practical examples, read the worked example and the project examples; Questions & answers has its own search box, and on Quiz each answer shows at once whether it is right and why (Start again resets it).
5. On Documents & mistakes, click Open template ↗ next to a key document and read the common mistakes and fixes; on Ask AI, ask the AI tutor about this part.
6. Use the Part 1–6 buttons at the top, or the ← Previous part and Next part → cards at the bottom, to move between parts on the same tab.

Outputs

- Checklist ticks, chosen level and latest quiz score saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- Key documents covered: security triage and security management plan, security strategy, security breach/incident management plan, information protocol, EIR, and the CDE workflow and procedure.
- The content is paraphrased guidance, not the standard's text; verify against the licensed edition.

Part 6

Part 6 (ISO 19650-6:2025, Health and safety information) sets requirements for sharing structured health and safety information throughout the project and asset life cycle. This page explains it at three levels, with 8 clauses, a 14-item compliance checklist, 5 practical examples, 10 questions and answers and a 6-question quiz.

How to use

1. Choose a tab: Overview, Clauses & checklist, Practical examples, Questions & answers, Quiz, Documents & mistakes or Ask AI.

2. On Overview, read In plain terms and Why it matters, then pick Beginner, Intermediate or Expert to change the depth of the explanation; key concepts and links to other parts follow.
3. On Clauses & checklist, read the key requirements, tick the compliance checklist items, and expand each clause in Deep dive — clause by clause.
4. On Practical examples, read the worked example and the project examples; Questions & answers has its own search box, and on Quiz each answer shows at once whether it is right and why (Start again resets it).
5. On Documents & mistakes, click Open template ↗ next to a key document and read the common mistakes and fixes; on Ask AI, ask the AI tutor about this part.
6. Use the Part 1–6 buttons at the top, or the ← Previous part and Next part → cards at the bottom, to move between parts on the same tab.

Outputs

- Checklist ticks, chosen level and latest quiz score saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- Key documents covered: AIR, EIR, the information delivery risk register, the information handover strategy and BIM meeting minutes.
- The content is paraphrased guidance, not the standard's text; verify against the licensed edition.

2026 revision (draft): what is changing

A hub on the draft 2026 revision of ISO 19650 Parts 1–3: where it stands, what is confirmed and what is only proposed, how the terms change, and what to do now. The current editions stay in force until the new ones are published.

How to use

1. Open the tabs in order: Where it stands, Key changes, Old and new terms, Part by part, What to do now, FAQ & quiz, and Sources & AI.
2. On What to do now, tick the checklist items as you complete them; the ticks are kept, and Clear empties the list.
3. In FAQ & quiz, pick an answer to see the explanation straight away; your score appears when all 4 questions are answered, and Try again resets the quiz.
4. In Sources & AI, click a suggested question or type your own and click Ask to use the AI tutor.
5. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The draft is not yet a published standard; keep working to the current editions on live appointments.

- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.

ISO 19650 essentials

The parts at a glance, the delivery process, CDE and status codes, glossaries and the information uses library.

Parts at a glance

The ISO 19650 knowledge library, open on Parts of the series: one card per part with its year, scope and key topics.

How to use

1. Read the card for each of the six parts: title, year, scope and key topic badges.
2. Type in Search this section... to filter the parts by title, scope or topic.
3. Use the buttons above the search box to switch between Parts of the series, Delivery process (19650-2), CDE & status codes and Glossary.
4. Use the tabs at the top (Library, Templates, Information uses, Naming & status codes, References) or the ISO 19650 — BIM / ISO/IEC 42001 — AI switch to move around the Knowledge hub.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Summaries are paraphrased for guidance; always refer to the licensed standard.
- For a full lesson on each part, use the All parts (1–6) learning hub.

Delivery process (19650-2)

The ISO 19650-2 delivery process as a clause tree: the eight activities from 5.1 Assessment and need to 5.8 Project close-out, each with its sub-clauses and their outputs.

How to use

1. Click an activity to expand it and read its summary.
2. Read each sub-clause's summary and the output badges it produces.
3. Type in Search this section... to find a sub-clause; matching activities open automatically.
4. Use the buttons above the search box to switch between Parts of the series, Delivery process (19650-2), CDE & status codes and Glossary.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Summaries are paraphrased for guidance; always refer to the licensed standard.
- For an interactive version showing who does what, open the Appointment process diagram hub.

CDE & status codes (quick reference)

A one-page quick reference for the CDE: the four information states and the suitability codes (UK National Annex) with the CDE state each belongs to.

How to use

1. Read the four state cards: Work in progress, Shared, Published and Archived.
2. Use the Suitability codes (UK National Annex) table to see each code, its CDE state and its meaning.
3. Type a code or a word in Search this section... to filter the codes table.
4. Follow the naming & status tool link at the bottom to check names and codes.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- The CDE deep guide in Topic hubs goes further: revision codes, transitions, set-up, platforms and daily operation.

ISO 19650 glossary (standard terms)

The key ISO 19650 terms as the standard defines them, in a searchable table of terms, abbreviations and paraphrased definitions.

How to use

1. Read the Term and Definition table; an abbreviation, where there is one, is shown before the term.
2. Type in Search this section... to filter by term, abbreviation or definition.
3. Use the buttons above the search box to switch between Parts of the series, Delivery process (19650-2), CDE & status codes and Glossary.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- For every BIM acronym in English and Arabic, use the Glossary & acronym decoder.

Glossary & acronym decoder (EN/AR)

A bilingual glossary of more than 400 BIM terms and acronyms, with each term and its definition in English and Arabic side by side, grouped into 12 categories.

How to use

1. Type in the search box in English or Arabic, for example MIDP or trigger event; results are sorted by relevance.
2. Click a letter to browse alphabetically (# for entries that start with a number), or click a category chip to filter by topic.
3. Tick Acronyms only to show only abbreviations.

4. On an entry, click a Related chip to jump to that term, or click Copy to copy the entry in both languages.
5. Click Clear filters to reset the search, letter, category and acronym filters.

Outputs

- Entry text in English and Arabic copied to your clipboard

Mandatory inputs

Nothing is mandatory.

Tips

- The address changes with your search, so you can share a link that opens the glossary on that term.
- Definitions are paraphrased for learning; check the published standard and your appointment documents for the exact wording.

Information uses library

A reference library of 32 information uses: the purposes for which information is produced (ISO 19650-1 §5.1). Choosing them early drives the information requirements, the level of information need, the MIDP deliverables and the capability expected of each task team.

How to use

1. Browse the uses by category: Capture, Design & analysis, Coordination, Quantities & cost, Time & logistics, Field & quality, Handover & assets and Operations.
2. Type in Search uses... to find a use by code, name, description or category.
3. Click All phases, Plan, Design, Construct or Operate to show the uses for that phase.
4. Read each card: description, value, inputs, deliverables, information need and capability, with the clause reference.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- To choose uses for a project and generate the Information Uses Schedule, open that project's Information uses page.

Topic hubs

In-depth guides on appointment, LOIN, COBie, Revit, CDE, BCF, handover, infrastructure and more.

All topic hubs

The landing page for all topic hubs: in-depth guides that sit alongside the ISO 19650 parts, grouped into five themes in a suggested learning order. Each hub has topics, worked examples, checklists, quizzes and an AI tutor.

How to use

1. Click a theme chip in the header to jump to it: The ISO 19650 process, Information requirements, Software, models & AI, Sectors & strategy, or Standards & AI governance.
2. Read the hub cards; each shows its place in the suggested order, a short introduction and how many topics you have explored.
3. Click a card to open the hub.
4. Click Resume → under Continue where you left off to return to the last topic you opened.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Progress bars come from this browser only, so they start empty on another device.

Appointment process diagram

An interactive ISO 19650-2 appointment process: who does what at each step, with inputs, activities, outputs and documents, plus a view for each party, decision gates, a RACI and a quiz.

How to use

1. Open a tab: Interactive diagram, Appointing party view, Lead appointed party view, Task team view, Milestones & decision gates, RACI by activity, Common pitfalls, Quiz or Ask AI.
2. On Interactive diagram, click Full process or a party (Appointing party, Lead appointed party, Appointed parties / task teams, Shared) to highlight its steps, then click any of the 16 steps to see who is responsible, the clause, inputs, activities, outputs and documents.
3. On the party view tabs and Milestones & decision gates, tick the checklist items as you work; the ticks are kept, and Clear empties a list.
4. In Quiz, pick an answer to see the explanation straight away; your score appears when all 10 questions are answered, and Try again resets the quiz.
5. In Ask AI, click a suggested question or type your own and click Ask to use the AI tutor; the “Generate an information management assignment matrix” card has an Open in AI document generator button.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

Documents aligned with roles

Shows which party produces which ISO 19650 document at each ISO 19650-2 stage, with a page for each party's documents and a short guide to the main documents. It has no quiz.

How to use

1. Pick a section and tab: Workflow overview (Document table, Summary matrix, Document flow, Colour legend), Appointing party (Requirements, Standards & methods, Tender, acceptance & close-out), Lead appointed party (Tender documents, Appointment documents, Delivery & close-out), Task teams / sub-appointed (Planning documents, Production documents) and Document guide (EIR, BEP, MIDP, TIDP, Responsibility matrix, Information protocol).
2. On Document table, filter with All parties or one party, All stages or one stage, or type in Find a document...; the table lists documents by stage and party.
3. Click a document to see its details, then click Open the ... template where one exists, or Close.
4. Tick checklist items as you work; the ticks are kept, and Clear empties a list.
5. Pick a section first, then a tab inside it; each section button shows how many of its tabs you have explored, and explored tabs carry a ✓.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics and checklist ticks saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

LOD / LOI / LOIN hub

A single hub for level of information need (LOIN), LOD 100–500 and LOI: what each means, how they compare, what is needed at each stage, an element library, worked examples and how to carry LOIN into the EIR, BEP and AIM.

How to use

1. Open a tab: Overview, LOIN explained, LOD 100–500, LOD 400 in Revit, LOI levels, Compare, By stage, Element & LOIN library, Practical specification, Worked examples, EIR/BEP transfer, AIM guide, Quiz and AI tools.
2. Tick checklist items as you work; the ticks are kept, and Clear empties a list.
3. In Quiz, pick an answer to see the explanation straight away; your score appears when all 10 questions are answered, and Try again resets the quiz.
4. In AI tools, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft a LOIN specification” card has an Open in AI document generator button.

5. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

COBie practical guide

A practical COBie guide: the sheets and what goes in them, a sheet-by-sheet reference of the schema, colour coding, delivery timing, authoring from Revit or Archicad, quality checks, the link to ISO 19650 and a delivery playbook.

How to use

1. Open a tab: Overview, Sheets explained, Sheet-by-sheet reference, Colour coding, Delivery timing, Authoring from Revit/Archicad, Quality checks, ISO 19650 link, Delivery playbook, FAQ, Quiz and AI tools.
2. Use Sheet-by-sheet reference to look up the full COBie schema; it loads when you open the tab.
3. Tick checklist items as you work; the ticks are kept, and Clear empties a list.
4. In Quiz, pick an answer to see the explanation straight away; your score appears when all 11 questions are answered, and Try again resets the quiz.
5. In AI tools, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft a COBie data requirements schedule” card has an Open in AI document generator button.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

Revit best practices

Revit best practice for ISO 19650 delivery, in three sections: everyday Revit set-up and modelling, advanced Revit topics, and using MCP to connect AI to Revit and other Autodesk software.

How to use

1. Revit section: Model setup, Templates & standards, Modelling by discipline, Naming, Shared parameters, Data & schedules, Worksets & collaboration, Families, IFC export, IFC mapping & validation, Coordination, Performance, Automation, Model QA checklist, Tips & shortcuts, FAQ, Quiz and AI tools.
2. Advanced Revit section: Federation & CDE, Data governance & IDS, Model health KPIs, Phases, options & assemblies and Revit API essentials. MCP for Revit & Autodesk section: Overview, Install & connect, How it works, ISO 19650 workflows, Writing good prompts, Governance & security, Videos & references, and FAQ & quiz.
3. Use Model QA checklist and the other checklists as you work; the ticks are kept, and Clear empties a list.
4. Take the 12-question Quiz in the Revit section or the 5-question quiz in FAQ & quiz; pick an answer to see the explanation straight away, and Try again resets a quiz.
5. In AI tools, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft a Revit modelling standard” card has an Open in AI document generator button.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- Pick a section first, then a tab inside it; each section button shows how many of its tabs you have explored, and explored tabs carry a ✓.
- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

Scan to BIM

A Scan to BIM hub covering reality capture from workflow to delivery: accuracy and LOD, hardware, software, the ISO 19650 view, use cases, challenges, an advanced workflow and a cost estimator.

How to use

1. Open a tab: Overview, Workflow, Accuracy & LOD, Hardware, Software, ISO 19650, Use cases, Challenges, Cost estimator, Quiz, AI tools and Advanced workflow.
2. On Cost estimator, enter Floor area (m²), Complexity, Model LOD, Scope, Day rate and Travel days; the total days, the cost at your day rate and a breakdown by activity update as you type.
3. Tick checklist items as you work; the ticks are kept, and Clear empties a list.
4. In Quiz, pick an answer to see the explanation straight away; your score appears when all 10 questions are answered, and Try again resets the quiz.
5. In AI tools, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft a scan survey specification” card has an Open in AI document generator button.

6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The estimator gives indicative planning figures, not a quotation; nothing you enter in it is saved.
- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

Infrastructure BIM & ISO 19650

Applying BIM and ISO 19650 to infrastructure: why it differs from buildings, IFC 4.3 and alignment, linear referencing, GIS–BIM integration and asset data, then sector-by-sector guidance for roads, rail, bridges, utilities, tunnels, ports and energy. It has no quiz.

How to use

1. In Overview, open Why infrastructure differs, IFC 4.3 & alignment, Linear referencing, GIS–BIM integration, Key standards, Asset data & classification, Information delivery pack, Sample document structures, Infra vs buildings, and Operations & digital twins.
2. Pick a sector section (Roads & highways, Rail & transit, Bridges & structures, Utilities (water, power, telecoms), Tunnels, Ports & waterways, Energy & power); each has Overview, Information requirements, CDE & federation, LOIN examples, Worked example and Challenges.
3. Tick checklist items as you work; the ticks are kept, and Clear empties a list.
4. In AI tools, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft an infrastructure EIR” card has an Open in AI document generator button.
5. Pick a section first, then a tab inside it; each section button shows how many of its tabs you have explored, and explored tabs carry a ✓.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics and checklist ticks saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

BIM dimensions (4D–7D, net zero)

The BIM dimensions beyond 3D: 4D time, 5D cost, 6D carbon and 7D asset and facilities management, plus net zero and an industry maturity benchmark, each with workflows, software, the ISO 19650 view and quizzes.

How to use

1. Sections: 4D BIM (Overview, Workflow, Software comparison, ISO 19650, Use cases, Challenges, Case studies, Clash detection, Quiz, AI tools), 5D cost (Overview, Workflow, ISO 19650, Software, Challenges, Quiz) and 6D carbon (Overview, Workflow, Standards & frameworks, ISO 19650, Tools, Quiz, AI tools).
2. More sections: 7D asset & FM (Overview, COBie and AIM handover, ISO 19650-3, CAFM / CMMS integration, Challenges), Net zero (Pathway, Targets & frameworks, Role of BIM data, Checklist) and Industry benchmark (Maturity benchmark, FAQ).
3. Take the Quiz tab in the 4D, 5D and 6D sections; pick an answer to see the explanation straight away, and Try again resets a quiz. Tick checklist items as you work.
4. In AI tools (4D and 6D sections), click a suggested question or type your own and click Ask to use the AI tutor; the “Generate a 4D planning execution plan” card has an Open in AI document generator button.
5. Pick a section first, then a tab inside it; each section button shows how many of its tabs you have explored, and explored tabs carry a ✓.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- In the 6D carbon section, the AI tools tab offers Generate a whole-life carbon assessment plan instead.
- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

CDE deep guide

An in-depth guide to the common data environment (CDE): the four states and metadata, suitability and revision codes, transitions and approvals, setting up and testing a CDE, choosing a platform and running it day to day.

How to use

1. Sections: Fundamentals (What a CDE is, The four states, Metadata), Status & revision codes (Suitability codes, Revision convention, Transitions & approvals), Setting up a CDE (Structure & naming, Permissions & workflows, Mobilisation testing, Audit trail), Platforms (Comparison,

Selecting a platform) and Operating the CDE (Routines, KPIs & failures, Security, Close-out & archiving, FAQ, quiz & resources).

2. On Transitions & approvals, click Full process or a party (Task team, Lead appointed party, Appointing party) to highlight its steps, then click a step to see its inputs, activities and outputs.
3. Tick checklist items as you work; the ticks are kept, and Clear empties a list.
4. In FAQ, quiz & resources, pick an answer to see the explanation straight away; your score appears when all 6 questions are answered, and Try again resets the quiz.
5. In FAQ, quiz & resources, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft CDE procedures” card has an Open in AI document generator button.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- Pick a section first, then a tab inside it; each section button shows how many of its tabs you have explored, and explored tabs carry a ✓.
- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

BCF learning hub

A learning hub for the BIM Collaboration Format (BCF): what it is, versions and the BCF API, how it fits ISO 19650, the issue lifecycle and clash coordination, coordination meetings, BCF support by software, and best practice for writing and reporting issues.

How to use

1. Sections: BCF basics (What BCF is, Versions & BCF API, BCF and ISO 19650), Issue lifecycle (From open to closed, Clash coordination, Coordination meeting), BCF by software (Tool comparison, On this platform), Best practice (Writing good issues, KPIs & reporting, Common mistakes) and FAQ, quiz & resources (FAQ, Quiz, Resources & AI).
2. On From open to closed, click Full process or a role (BIM coordinator, Responsible task team, Lead appointed party) to highlight its steps, then click a step to see its inputs, activities and outputs.
3. Use the Coordination meeting checklist as you run a meeting; the ticks are kept, and Clear empties the list.
4. In Quiz, pick an answer to see the explanation straight away; your score appears when all 6 questions are answered, and Try again resets the quiz.
5. In Resources & AI, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft a BCF and issue management procedure” card has an Open in AI document generator button.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- Pick a section first, then a tab inside it; each section button shows how many of its tabs you have explored, and explored tabs carry a ✓.
- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

Façade BIM coordination

BIM coordination for façades as a specialist package: design responsibility, LOIN by stage, interfaces with other trades, modelling and panel identification, tolerances, coordination and clash tests, mock-ups, digital fabrication and façade asset information.

How to use

1. Sections: The façade package (Overview, Design responsibility, LOIN by stage), Interfaces & modelling (Interfaces, Modelling approach, Panel identification, Tolerances & movement), Coordination & testing (Coordination cycle, Façade clash tests, Mock-ups & testing), Fabrication & handover (Digital fabrication, Asset information, Common mistakes) and FAQ, quiz & AI (FAQ, Quiz, AI tools).
2. Tick checklist items as you work; the ticks are kept, and Clear empties a list.
3. In Quiz, pick an answer to see the explanation straight away; your score appears when all 6 questions are answered, and Try again resets the quiz.
4. In AI tools, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft façade information requirements” card has an Open in AI document generator button.
5. Pick a section first, then a tab inside it; each section button shows how many of its tabs you have explored, and explored tabs carry a ✓.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

Handover guide (PIM → AIM)

How to hand over the PIM as an AIM: the handover strategy and timeline, roles, what to hand over, acceptance and status, the health and safety file, data quality checks, loading into CAFM/CMMS, KPIs, a 12-week plan and what happens after handover.

How to use

1. Sections: Strategy & timeline (Overview, Timeline, Roles), Content & acceptance (What to hand over, Acceptance & status, Documents & H&S file), Data quality & systems (Data quality checks, Loading into CAFM/CMMS, KPIs), Plan & operation (12-week plan, Readiness checklist, After handover, Common mistakes) and FAQ, quiz & AI (FAQ, Quiz, AI tools).
2. Work through Readiness checklist and the Documents & H&S file checklist before handover; the ticks are kept, and Clear empties a list.
3. In Quiz, pick an answer to see the explanation straight away; your score appears when all 6 questions are answered, and Try again resets the quiz.
4. In AI tools, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft an information handover strategy” card has an Open in AI document generator button.
5. Pick a section first, then a tab inside it; each section button shows how many of its tabs you have explored, and explored tabs carry a ✓.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

BIM standards timeline

The history of BIM standards, from the British foundations (BS 1192 and PAS 1192) to ISO 19650 and its 2026 revision, the openBIM standards (IFC, BCF, IDS, COBie) and national adoption, including a Middle East focus.

How to use

1. Sections: The big picture (Timeline, What replaced what), Eras (British foundations, The ISO era, The 2026 revision), openBIM standards (IFC; BCF, IDS and COBie; UK BIM Framework and GSL), National adoption (Selected adoptions, Middle East focus) and FAQ, quiz & links (FAQ, Quiz, Links & AI).
2. Use What replaced what to map older documents to the standards that replaced them.
3. In Quiz, pick an answer to see the explanation straight away; your score appears when all 6 questions are answered, and Try again resets the quiz.
4. In Links & AI, click a suggested question or type your own and click Ask to use the AI tutor.

5. Pick a section first, then a tab inside it; each section button shows how many of its tabs you have explored, and explored tabs carry a ✓.
6. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics, checklist ticks and best quiz scores saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

BIM implementation best practices

Best practice for implementing BIM in an organisation: strategy, maturity, people, process, technology, standards, KPIs and common mistakes. It has no quiz.

How to use

1. Open a tab: Strategy, Maturity, People, Process, Technology, Standards, KPIs, Common mistakes and AI tools.
2. Use the checklists on Process and Common mistakes to review your own approach; the ticks are kept, and Clear empties a list.
3. In AI tools, click a suggested question or type your own and click Ask to use the AI tutor; the “Draft a BIM implementation strategy” card has an Open in AI document generator button.
4. Type at least three letters in the search box to find a topic anywhere in the hub; use the ← Previous and Next → cards at the bottom to read in order, and after the last tab a card links to the next hub.

Outputs

- Explored topics and checklist ticks saved in this browser

Mandatory inputs

Nothing is mandatory.

Tips

- To track adoption step by step with owners and due dates, use the ISO 19650 adoption roadmap.
- The Related topics panel at the bottom links to related hubs, to tools under Put it into practice, and to the ISO 19650 parts behind the topic.
- A lock on a section or tab means your plan does not include it; the rest of the hub stays open.

References

The published sources behind the ISO 19650 and ISO/IEC 42001 content.

ISO 19650 references

A list of ISO 19650 and related BIM standards and guidance, with the publisher and a short note for each.

How to use

1. Read the table: Reference, Publisher and Notes.
2. Where a reference has a link (marked ↗), click it to open the source in a new tab; the others are listed by title only.
3. Use the tabs at the top (Library, Templates, Information uses, Naming & status codes, References) or the ISO 19650 — BIM / ISO/IEC 42001 — AI switch to move around the Knowledge hub.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- For a summary of each part, open Parts of the series in the Library tab.

ISO/IEC 42001 references

A list of ISO/IEC 42001 and related AI management and governance standards and guidance, with the publisher and a short note for each.

How to use

1. Read the table: Reference, Publisher and Notes.
2. Where a reference has a link (marked ↗), click it to open the source in a new tab; the others are listed by title only.
3. Use the Library, Templates and References tabs, or the ISO 19650 — BIM / ISO/IEC 42001 — AI switch, to move around the Knowledge hub.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- The ISO/IEC 42001 library lists clauses 4–10, the Annex A controls and AI in BIM use cases.

6. Documents & delivery

Purpose. Tools to understand, write and check ISO 19650 documents without needing a project. Each document is explained, generated from your project data and checked before you issue it.

When to use it. When you need to write an EIR, BEP, TIDP, MIDP or any other document, or check names and codes before sharing.

Start with: Project workflow. The numbered steps follow the order work is done: understand the workflow and roles, enter project data once, create documents, check them, then reach for templates and samples.

Workflow & roles

The ten project stages, every document by stage, how files move through the CDE, who does what, and a guide to every ISO 19650 document.

Project workflow

Walks through the ten project stages from need to asset operation. For each stage it shows the steps, the gate, the documents, who does what, pitfalls and the tools to use.

How to use

1. Click a stage in the numbered stepper at the top.
2. Read “What happens, in order” and the checks under “Gate: done when”.
3. Check “Documents in this stage”; each one is tagged Create, Update, Approve or Use.
4. Review “Who does what in this stage” and click a role to open its profile.
5. Read “Pitfalls and how to prevent them” and open a tool from “Tools for this stage”.
6. Use the buttons at the bottom to move to the previous or next stage.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Documents by stage

A table of every document by ISO 19650-2 stage (clauses 5.1 to 5.8) and by party: appointing party, lead appointed party, and task teams / sub-appointed parties. Every stage and document opens a detailed explanation.

How to use

1. Narrow the table with “Filter by stage” (or “All stages”) and the party buttons (or “All parties”).
2. Click a cell, “Expand row” or “Expand all” to list the documents; “Collapse all” folds them again.
3. Click a document to open its panel: purpose, what it must contain and, where a guide exists, who writes and approves it, what to write, how to create it, checks and common mistakes.

4. From the panel, click “Open the full guide”, “Open the template” or “Draft it with AI”.
5. Click a stage name to see what happens in it, who does what and its gate; press Escape or ✕ to close the panel.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Document workflow

Shows step by step how information moves through the CDE states WIP, Shared, Published and Archived: who acts, the status code and revision at each step, the checks and what goes wrong.

How to use

1. Choose a flow: “Information container through the CDE”, “Controlled document (e.g. BEP or EIR) review and approval” or “Handover information to the AIM”.
2. Read the flow summary and the number of steps in each CDE state.
3. Follow each numbered card: its state, status code, revision, “Who”, “Actions”, “Checks” and the failure warning.
4. Use the links at the bottom: “CDE & status codes”, “File naming checker” and “Suitability code hub”.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Roles by stage

A RACI matrix of every role against the ten project stages: who is Accountable, Responsible, Consulted and Informed.

How to use

1. Read the key A, R, C and I at the top.
2. Click a role name to highlight its row.
3. Click any cell to read that role's duty in that stage.
4. In the duty box, click “Open the stage” or “Open the role profile”.
5. Click a stage number in the header to open that stage in the project workflow.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Role profiles

A profile of each project role: summary, responsibilities, documents it owns, measures of success, its duty at every stage, skills and tools.

How to use

1. Pick a role from the list on the left; the BIM manager opens by default.

2. Read the summary, “Responsibilities”, “Documents this role owns” and “Measures of success”.
3. Check “Across the project” for the role's RACI letter and duty in each stage; click a stage to open it.
4. Review “Skills” and open a tool from “Tools for this role”.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Project data & setup

Enter the project's mandatory facts once and every generator reuses them; the setup wizard tells you which documents and workflow you need.

Setup wizard

Six questions about your role, the project stage, the asset type, handover for operation, security and AI use. It recommends the ISO 19650 documents, standards and tools to start with, and creates the documents in a project.

How to use

1. Answer each question by clicking an option; click “← Back” to change an earlier answer.
2. On “Your starting set”, untick any recommended document you do not need.
3. Read the standards and the “Tools to use next”.
4. Under “Create the documents in”, choose “A new project” or one of your projects.
5. For a new project, enter the “Project name” and “Project code”.
6. Click “Create N documents” (N is the number ticked); “Start again” clears the answers.

Outputs

- A new project with the recommended standards in scope (when you choose a new project).
- Draft documents created from the recommended templates in the project's documents; documents that already exist are skipped.

Mandatory inputs

- At least one document ticked
- Project name (at least 2 characters; new project only)
- Project code (2–6 letters or digits; new project only)

Tips

- To add documents to an existing project you need editor rights in it.

Project data (enter once)

The common project data you enter once; the document generator, delivery plans, naming checker and Word exports reuse it. No document can be generated until the eight hard-minimum inputs are complete. The data is saved in this browser.

How to use

1. Optionally choose a project in “Fill from a portal project:” and click “Fill” to copy its name, code, client, milestones, task teams and deliverables.
2. In section 1, enter the project and client; in section 2, add stages with dates using “Quick fill:” or “+ Add stage”.
3. In section 3, add disciplines with their organisations (“+ Add discipline”); in section 4, choose at least one information purpose.
4. In section 5, set the naming fields (“+ Field”, “Reset to ISO order”), the separator and the classification system; in section 6, name the CDE platform.
5. In section 7, add deliverables with a format and a milestone (“+ Add deliverable” or “Start with a typical list”).
6. In section 8, “Inputs specific to each document”, open a document tab and fill the fields marked *.
7. Check section 9, “Generation order”, then click “Open the document generator” or “Open delivery plans (TIDP / MIDP)”.

Outputs

- Project data saved in this browser and reused by the document generator, delivery plans, naming checker and every Word export.

Mandatory inputs

- Project name, project code and appointing party (client) (all three)
- Project stages (at least one stage with a name and a start or end date)
- Disciplines (at least one discipline with its organisation)
- Information purposes (at least one chosen)
- Naming convention fields (at least three)
- Classification system (choose one)
- CDE platform (name it)
- Deliverables (at least one with a format and a milestone)

Tips

- Fields marked * in section 8 are only required when you generate that document type.
- The data stays in this browser: on another computer use “Fill” or enter it again.

Client standards

Stores each client's information requirements, imported once from their EIR appendix workbooks: COBie schema and picklists, required fields by stage, the asset attribute dictionary with the stages (and parties) each attribute is due at, the classification dictionary and the asset tag format. Only the extracted rules are stored, not the files.

How to use

1. Under “New standard”, type a name and the client, then click “Create”.
2. On the standard's page, drop .xlsx appendix workbooks or click “⬆ Import workbooks”; a message lists the tables found in each file.

3. Review “Required by stage” (COBie fields · asset attributes), the “Picklists”, the “COBie rules” for each sheet and the “Asset attribute dictionary”.
4. Set the “Asset tag format”: separator, COBie field and parts with length, characters and approved codes (“+ Add part”), then click “Save tag format”.
5. Search the “Classification dictionary” by equipment, code, Uniclass or IFC; “Delete standard” removes the standard and detaches the projects using it.

Outputs

- A saved client standard (COBie rules, picklists, stage requirements, classification entries and tag format) that can be applied to projects.

Mandatory inputs

- Name (at least 2 characters)
- Appendix workbooks (.xlsx; tables are recognised by their headers)
- Tag format: a separator, a COBie field and at least one part, each with a label

Tips

- Import up to 20 workbooks at a time; the files themselves are not kept.
- Equipment codes are checked per system: a tag pairing an equipment code with a system it is not listed under is rejected.
- COBie validation at a stage reports every required attribute missing from its mapped column or from the Attribute sheet (by parameter name).

Create

Generators for documents, delivery plans, risk registers, clash matrices, meeting minutes and transmittals.

Document generator

Drafts any ISO 19650 document from a description: it plans an outline (from the portal's template when one exists), drafts it section by section and exports it to Word. For a full EIR, or a BEP that answers an EIR, use the AI studio writers.

How to use

1. Complete the project data hard minimum (click “Complete project data →”) and the “Document data — required before generating the document” fields.
2. Choose “Project draft” or “Reusable template”, then pick a document from the quick lists or type it in “Document type *”.
3. Add project facts and requirements; the more you give, the less is marked [CONFIRM].
4. Click “Plan the document →”, then untick, rename or add sections (“+ Add a section”) in the outline.
5. Click “Draft N sections →” and watch the sections appear; use “Redo” on a section, with an optional instruction, then “Redo now”.
6. Click “Download Word (.docx)”, or use “Markdown” or “Copy”; “New document” starts again.

Outputs

- Word document (.docx) with the cover page and document control table filled from the document data
- Markdown file (.md) of the same draft
- A list of items to confirm, highlighted in the draft and in Word

Mandatory inputs

- Document type (at least 2 characters)
- Document data: project name, document reference, version / revision, organisation name, organisation role, project stage, status and prepared by
- Project data hard minimum (8 of 8, on the Project data page)
- For an EIR, AIR, BEP, TIDP or MIDP: that document's inputs marked *

Tips

- AI must be switched on by an administrator.
- If an earlier document in the generation order is not produced yet, a warning appears; you can still continue.

BEP writer

Writes a pre- or post-appointment BEP that answers the client's EIR point by point, using your company profile, with an EIR response matrix, risks and tender clarifications. Without an EIR it writes from a short project brief.

How to use

1. In step 1, choose “From the client's EIR” and upload a PDF, DOCX, TXT or MD file or paste the text, or choose “From a project brief (no EIR)” and describe the project; add the “Project name”.
2. In step 2, “Company profile”, fill in your company details; blank fields are marked [TBC]. The profile is saved in this browser.
3. In step 3, “Choose the BEP”, pick “Pre-appointment BEP” or “Post-appointment BEP”.
4. Click “Generate BEP”; the sections are written in batches.
5. In “Review and edit”, check the coverage figures, edit each section and use “Regenerate this section”, with an optional “Note for regeneration (optional)”.
6. Edit the “EIR response matrix”, “Risks” and “Clarifications to raise at tender”, then click “Download Word” or “Copy”.

Outputs

- BEP Word document (pre- or post-appointment) including the EIR response matrix, risks and clarifications
- Coverage figures: EIR requirements answered and not answered, and the coverage percentage

Mandatory inputs

- The EIR (file or pasted text), or a project brief (at least 20 characters)

Tips

- AI must be switched on by an administrator.

- Use “Check it with the compliance matrix” to test the draft against the EIR.
- Complete every [TBC] and have the accountable person approve the BEP before submission.

TIDP / MIDP / MPDT generator

A standalone generator for a TIDP, MIDP or MPDT (model production and delivery table) without a project: starter rows per discipline or AI rows, ISO 19650 container names, checks, and an Excel workbook in the MIDP / TIDP template layout. The plan is kept in this browser.

How to use

1. Choose TIDP, MIDP or MPDT at the top.
2. Complete the project data the page asks for (the gate at the top) and the document data panel, then fill in the plan details: project code and originator for container names, task team and discipline for a TIDP.
3. List the milestones (code, name, date): each one is a data exchange in the workbook.
4. Click "Standard starter list" or "Generate with AI", or "+ Add row"; for a deliverable issued at several exchanges, add one row per milestone with the same type, role and number.
5. Edit the rows in the table: description, native and exchange formats, model reference, cost code, LOIN, dates, responsible, suitability and status. Rows with problems are marked; hover to read why.
6. To start from a filled template, click "Import template (.xlsx)"; "Import CSV" / "Import TIDP CSVs" read CSVs exported from this tool.
7. Export with "Excel (.xlsx)", "Word (.docx)" or "CSV".

Outputs

- Excel workbook in the MIDP / TIDP template layout (document control, instructions, MIDP and a TIDP sheet per task team; MPDT as a single table)
- Word document (.docx)
- CSV of the rows

Mandatory inputs

- The project data minimum shown at the top of the page
- The required document data fields (marked in the document data panel)
- A title for every row

Tips

- AI rows need AI to be switched on for the portal; the starter list works without it.
- The plan is saved in this browser only. To share it, export the workbook or use the project MIDP / TIDP planner.

Risk register starter

Drafts a starter list of project-specific information delivery risks, each with likelihood, impact, ISO clause, mitigation, owner and residual score. Manage the live register in the project.

How to use

1. Fill in “Project type”, “Stage”, “Delivery team size”, “CDE platform” and “Procurement route” (examples are filled in).

2. Choose the “Number of risks” (15, 25 or 35) and add “Notes (constraints, client concerns, known issues)”.
3. Click “Generate risk register”.
4. Review the “Heat map (inherent)”, the “By category” counts and the register table with inherent and residual scores.
5. Export with “Excel (CSV)” or “Word”.

Outputs

- Risk register as a CSV file for Excel
- Risk register as a Word document

Mandatory inputs

Nothing is mandatory.

Tips

- AI must be switched on by an administrator.
- The register is a starting point: review every risk, owner and score before you use it.

Clash test matrix (plan the tests)

Before clash runs, plans which discipline pairs to test, with tolerances, priorities and frequencies suited to your stage, LOD and software.

How to use

1. Choose the “Project type”, “Stage”, “Software” and “LOD”.
2. Tick the “Disciplines” to include in the tests.
3. Add any “Special requirements”, such as a tight ceiling void or prefabricated MEP modules.
4. Click “Build clash matrix”.
5. Review the matrix (tolerance in mm and priority for each pair), the list of clash tests and the “Running and reporting” guidance.
6. Click “CSV” to export the tests.

Outputs

- Clash test list as CSV: code, selections A and B, type, tolerance (mm), priority, frequency and notes

Mandatory inputs

- Disciplines (at least two ticked)

Tips

- AI must be switched on by an administrator.

Meeting minutes (AI)

Turns rough notes or a Teams or Zoom transcript into formal minutes with attendees, agenda items, decisions, actions with owners and dates, and risks. Names and dates not in the notes are left as TBC.

How to use

1. Enter the “Meeting title”, “Date”, “Project”, “Chair” and the attendees, one per line: name, organisation, role.

2. Paste the notes in “Notes or transcript”, or click “Load .txt, .vtt or .docx”.
3. Click “Write the minutes”.
4. Check and edit the attendees, apologies, agenda items, decisions, actions (“Add action”), risks (“Add risk”) and next meeting.
5. Export with “Download Word”, “Actions CSV” or “Copy as text”.

Outputs

- Minutes as a Word document
- Action list as CSV (ref, action, owner, due, status)
- Minutes as plain text copied to the clipboard

Mandatory inputs

- Notes or transcript (at least 20 characters, up to 120,000)

Tips

- AI must be switched on by an administrator.
- Check every name, date, decision and action against the meeting before you issue the minutes.

Transmittals & letters

Builds a transmittal from a list of container names, checking each name and taking the purpose of issue from its status code (no AI needed). An AI writer drafts RFIs, rejections, non-conformance notices, reminders, transmittal cover notes and general letters that cite ISO 19650.

How to use

1. In “Transmittal builder”, enter the “Project code”, “From”, “To”, “Date”, “Transmittal no.” (a number is suggested) and “Reason for issue”.
2. Paste the “Container names”, one per line, with the status and revision as columns or as the last fields of the name; “Try an example” shows the format.
3. Check the “Schedule of containers”: each name is checked against ISO 19650 naming and problems are listed per row.
4. Click “Download Word”, “Download CSV” or “Copy” to issue the transmittal.
5. In “AI correspondence writer”, pick a letter type and fill “To”, “From”, “Project” and “Context”; optionally tick “Include the transmittal containers as context” or click “Use transmittal details”.
6. Click “Draft the letter”, edit the subject and body, then click “Download Word” or “Copy”.

Outputs

- Transmittal as a Word document and as CSV
- Letter or notice as a Word document

Mandatory inputs

- Container names (at least one, for a transmittal)
- Context (at least 10 characters, for a letter)

Tips

- The transmittal builder works without AI; the letter writer needs AI switched on by an administrator.
- Containers with problems are listed as exceptions on the transmittal; correct them before issue where you can.
- Fill in every [TBC] in a drafted letter before you send it.

Check

Review and compare documents, check file names in bulk, build a single container name and look up status and suitability codes.

Document review & compare

Reviews one document against the checklist for its type, checks a BEP against its EIR, or compares two BEP versions. It gives a score, a verdict, a compliance matrix and findings with fixes. For a full EIR ↔ BEP matrix, use the AI studio.

How to use

1. Choose a mode: “Single document review”, “EIR ↔ BEP compliance” or “BEP version compare”.
2. For a single review, pick the document type or leave “Auto-detect document type”.
3. Upload a PDF, DOCX or TXT file (up to 25 MB) or paste the text; for the two compare modes, provide both documents.
4. Click “Run compliance review”; a full review usually takes 1–2 minutes.
5. Read the score, verdict, summary, coverage table and findings; click the chips to filter by status or severity.
6. Export with “Download report (Word)”, “Compliance matrix (CSV)” or “Findings (CSV)”.

Outputs

- Review report as a Word document (score, verdict, coverage and findings)
- Compliance matrix as CSV
- Findings as CSV

Mandatory inputs

- The document to review (file or pasted text)
- For EIR ↔ BEP compliance and BEP version compare: both documents

Tips

- AI must be switched on by an administrator.
- The review is decision support: the accountable reviewer must confirm each finding.

File naming checker

Checks hundreds of file or container names at once against the ISO 19650-2 UK National Annex fields, your project code and your delivery plan, and suggests corrected names. Only names are read: files never leave your computer.

How to use

1. Check the “Project code”, the optional “Originator codes” and the “Field separator”; tick the delivery plan match if a TIDP or MIDP is saved.
2. Paste names one per line, or drop files or “choose a whole folder”; “Try an example” fills in sample names.
3. Read the counters (names checked, correct, to confirm, wrong) and click one to filter the table.
4. Read “What to fix” on each row and click a suggested name to copy it.

5. Use “Copy N corrected names”, “Copy Windows rename commands”, “Export CSV” or the “Not in plan” filter.

Outputs

- Naming check report as CSV (name, result, problems, suggested name, in delivery plan)
- Corrected names and Windows rename commands copied to the clipboard
- A list of planned containers that have no file in the list

Mandatory inputs

- File or container names (at least one, one per line)

Tips

- The project code and separator come from the Project data page when it is filled in.

Naming & status code tool

Builds one information container name from the UK National Annex fields, validates a pasted name field by field, and lists the status (suitability) codes with their CDE state.

How to use

1. In “Generator”, fill each field: Project, Originator, Volume / System, Level / Location, Type, Role and Number; invalid fields are outlined in red.
2. Read the “Result” name and click “Copy”.
3. In “Validator”, paste a container name to check each field.
4. Look up a code in the “Status (suitability) codes” table.

Outputs

- A container name copied to the clipboard

Mandatory inputs

- Project (2–6 letters or digits)
- Originator (3–6 letters or digits)
- Volume / System (1–2 letters or digits)
- Level / Location (2 letters or digits)
- Type (2 characters, chosen from the list)
- Role (1–2 letters, chosen from the list)
- Number (4–6 digits)

Tips

- The validator expects exactly seven fields separated by “-”, without a status code or revision at the end.

Suitability code hub

Helps you pick the right status (suitability) code: a quick wizard for common cases, an AI advisor for tricky situations, and a quick reference of every code with its CDE state.

How to use

1. In “Quick wizard”, answer the questions by clicking an option until a code appears with its CDE state.
2. Click “Start again” to reset the wizard.
3. For a tricky case, describe it in “AI advisor for complex situations” and click “Advise”.
4. Read the suggested code, explanation, next step, alternatives and cautions.
5. Check the “Quick reference” table, where the chosen code is highlighted.

Outputs

Reading page: no files or records produced.

Mandatory inputs

- Situation description (at least 10 characters; AI advisor only)

Tips

- The AI advisor appears only when AI is switched on; the quick wizard always works.
- Codes follow the UK National Annex to ISO 19650-2; your project's information standard may define its own.

Templates & samples

ISO 19650 and ISO/IEC 42001 templates, structured sample documents and the curated downloads library.

Document guides

Explains every ISO 19650 document: what it is, who writes and approves it, what goes in each section, how to create it step by step and what to check before issue.

How to use

1. Search with “Search documents…” or browse the four phases, from requirements to handover.
2. Click a document card to open its guide.
3. Read “What it is”, “Why it matters”, “Who and when” and the “Document chain”; use the bar under the title to jump to a part.
4. Open each section under “What to write, section by section” for guidance and an example, and follow “How to create it”.
5. Tick the “Quality checklist” before issue and read the “Common mistakes”.
6. Click “Open the template” or “Draft it with AI” to start the document.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Checklist ticks are saved in this browser.
- Some guides start with a worked example and case studies (Deep dive).

ISO 19650 templates

The ISO 19650 template library: structured templates for the EIR, BEP, TIDP, MIDP and every other document, with sections, guidance and clause references. Use one to create a controlled document in a project.

How to use

1. Search with “Search templates…” or browse the templates by category.
2. Click “Contents” to see a template's sections and fields.
3. Click “Read the guide” to learn how to write the document.
4. Click “Use in project…”, choose the project and click “Create document”.
5. Under “House templates”, find the versions your organisation saved from its own documents.

Outputs

- A controlled document created from the template in the chosen project, opened for editing

Mandatory inputs

- A project with ISO 19650 in scope where you are an editor

Tips

- Templates generated from a project register (such as the TIDP, MIDP or risk register) are created from that register instead: follow the notice in the dialog.

ISO/IEC 42001 templates

The ISO/IEC 42001 template library: AI policy, AI risk assessment, AI impact assessment and the other documents of an AI management system (AIMS). Use one to create a controlled document in a project.

How to use

1. Search with “Search templates…” or browse the templates by category.
2. Click “Contents” to see a template's sections and fields.
3. Click “Use in project…”, choose the project and click “Create document”.
4. Under “House templates”, find the versions your organisation saved from its own documents.

Outputs

- A controlled document created from the template in the chosen project, opened for editing

Mandatory inputs

- A project with ISO/IEC 42001 in scope where you are an editor

Sample documents

Structured Word samples of the EIR, AIR, OIR, pre- and post-appointment BEP, project information standard, information protocol and security triage, with the correct sections, clause references and guidance notes.

How to use

1. Click “Preview” on a sample to list its sections and guidance.

2. Click “Download Word” to get the structured sample.
3. Click “Use in a project” to open the template and create a controlled document from it.
4. Click “AI-filled sample” to have the document generator draft a filled example for a fictional project.
5. For a PIR, click “Draft PIR with AI”.

Outputs

- A structured Word sample (.docx) with placeholders for every field

Mandatory inputs

Nothing is mandatory.

Tips

- When the document data (entered in the document generator) is complete, the download fills the cover and document control with your project, reference, version and author.

Downloads library

A library of templates, checklists, guides and worked examples curated by the platform administrators, in Word, Excel, PDF, DWG, IFC and other formats.

How to use

1. Search with “Search resources…”, sort by “Newest first”, “Most downloaded” or A–Z, and filter with “All categories”.
2. Click “Preview” to view a file in the page, where available.
3. Click “Download” to save the file.
4. Administrators: under “Add a resource”, choose a file, title, category, ISO 19650 part and short description, then click “Add to library”; “Delete” removes a resource.

Outputs

- Downloaded files
- A new library resource (administrators only)

Mandatory inputs

- File (administrators adding a resource)
- Title (at least 2 characters; defaults to the file name)

Tips

- Only upload material you have the right to share.

7. Models & coordination

Purpose. Checks you run on model files and the issue tools you coordinate with. Files are checked in the page; you do not need a project to try them.

When to use it. Before you share a model, before a coordination meeting and when you write model requirements.

Start with: Revit project check. Check your own models first, then coordinate with others through IDS requirements and BCF issues.

Check models

Revit project health, graded IFC QA/QC, the IFC hub for LOIN and IDS checks, and the COBie data checker.

Revit project check

Check an open Revit model against your project rules: naming, Project Information, sheets, required parameters and model health. The check runs read-only inside Revit, then you open the results here for a grade and the failing elements.

How to use

1. Add the project code in Project data first, so the file name and Project Number are checked against it.
2. In step 1, choose “Review or edit the rules” to set the sheet rules, Project Information parameters, the parameters each category must carry and the model health limits.
3. In step 2, pick “pyRevit button” and choose “Download pyRevit extension (.zip)”, or pick “Claude through MCP” and choose “Copy the prompt for Claude”.
4. Run the check in Revit: click ISO 19650 › Project rules check, or paste the prompt into Claude with the model open.
5. In step 3, drop the results file (.json) from Documents\ISO19650 checks, or paste Claude's answer and choose “Open pasted results”.
6. Review the grade, filter by Failed, To confirm, Passed or Information, and open a check to see its elements; use “Copy element IDs for Revit's Select by ID” to find them in Revit.
7. Choose “Export CSV” to share the results. Each check is added to the History, so you can see the model improve.

Outputs

- pyRevit extension (.zip), script only (.py) and rules (.json) files
- Grade A–F with a score out of 100
- Failing elements with their Revit element IDs

Mandatory inputs

- Results file from the Revit check (.json), or the JSON answer pasted from Claude

- CSV export of every check
- History of past checks per model (saved in this browser)

Tips

- The rules are written into the script, so download it again after you change them.
- The check only reads the model. Rules and history are saved in this browser only.

QA/QC model checker

Grade IFC models A–F against ISO 19650 information-quality checks. Check one model, or up to 10 side by side to compare them. Files are read in your browser and nothing is uploaded.

How to use

1. Drop one IFC file on the drop area, or up to 10 to compare, or click the area to browse.
2. Wait while the models are read one at a time. The table shows grade, score, schema, elements, errors, warnings and each check.
3. Click a row to see that model's checks and issues, and filter the issues by Errors, Warnings or Notes.
4. Choose “Download report (Word)” for a QA/QC record, or “Comparison (CSV)” for a spreadsheet.
5. Drop more files to start a new comparison.

Outputs

- Grade A–F and score out of 100 per model (A ≥ 90, B ≥ 75, C ≥ 60, D ≥ 40)
- IFC model QA/QC report (Word)
- Comparison table (CSV)

Mandatory inputs

- IFC files (.ifc; IFC 2×3, IFC 4 or IFC 4.3; up to 300 MB each; up to 10 files)

Tips

- IFC ZIP and IFCXML are not supported. Export a plain .ifc file from your authoring tool.
- The automated checks support, and do not replace, the delivery team's own QA.

IFC Hub (explore a model)

Explore one IFC model: its classes, storeys, elements and property sets. Check it against LOIN rows or an IDS file, and ask AI to compare it with your EIR.

How to use

1. Drop an IFC file on the drop area, or click the area to browse.
2. In “Building analysis”, review the score, elements by class, storeys, ISO 19650 model checks and issues.
3. In “Elements”, search by name, GUID, type or storey, click a row to see its property sets, and choose “Elements (CSV)” to export the list.
4. In “Property coverage”, pick a class to see how often each property is filled.

5. In “LOIN / IDS validator”, edit the rows (use Pset.Property, and =value to require a value) or choose “Load IDS file”, then choose “Check requirements”.
6. In “AI comparison with your EIR”, paste the requirements, choose “Compare with AI”, and export the table with “Comparison (CSV)”.
7. Choose “Check another file” to start again.

Outputs

- Model score and grade with ISO 19650 checks and issues
- Element list (CSV)
- Pass rate per LOIN or IDS requirement, with the first failing elements
- AI comparison table: met, partial, missing or unclear, with an action for each requirement (CSV)

Mandatory inputs

- IFC file (.ifc; IFC 2×3, IFC 4 or IFC 4.3; up to 300 MB)
- For the AI comparison: requirements text (at least 20 characters)

Tips

- Only a summary of the model (classes, fill rates and checks) is sent to AI, never the file itself.
- IDS classification, material and part-of facets are not checked yet.

COBie data checker

Check a COBie workbook for handover readiness. Built-in rules check the sheets and required fields, then AI gives a readiness verdict and a prioritised list of fixes.

How to use

1. Choose a COBie .xlsx workbook, or paste sheet data copied from Excel.
2. Pick the stage, for example “Handover / practical completion”.
3. Choose “Check COBie data” and wait for the review.
4. Read the readiness, rule score and summary, then work through the prioritised fixes.
5. Choose “CSV” above the fixes table to export them.

Outputs

- Readiness verdict: Ready, Minor fixes or Not ready
- Rule score out of 100 and errors and warnings per sheet (workbooks only)
- Prioritised fixes P1–P3 with sheet, issue, fix and owner (CSV)

Mandatory inputs

- COBie workbook (.xlsx, up to 25 MB) or pasted COBie sheet data

Tips

- Pasted data gets the AI review only. Upload the workbook to get the rule checks too.
- AI must be switched on by an administrator (Claude API key on the server).

Coordination

Write model requirements as an IDS file and open, edit and convert BCF issue files.

IDS builder

Write model requirements as a buildingSMART IDS 1.0 file that model checkers can run. Your draft is saved in this browser.

How to use

1. Fill in “Information”: the Title is required; author (an e-mail address), version, date, purpose and milestone are optional.
2. Choose “+ Add specification” or “Add preset ▾”, or choose “Import .ids” to load an existing file.
3. For each specification, enter the name, tick the IFC versions and enter the IFC entity it applies to (separate several with |).
4. Add requirements with “+ Attribute”, “+ Property”, “+ Classification” or “+ Material”, and set the value rule and cardinality.
5. Optional: paste EIR or LOIN text under “AI helper”, choose “Extract requirements with AI”, and review each new specification.
6. Fix the errors listed under “Checks”.
7. Choose “Download .ids”, or “Copy XML”.

Outputs

- IDS 1.0 file (.ids)
- IDS XML copied to the clipboard

Mandatory inputs

- Title
- At least one specification, each with a name, at least one IFC version and an IFC entity
- Property requirements: property set and property name; attribute requirements: attribute name
- AI helper: at least 20 characters of EIR or LOIN text

Tips

- IDS does not include subtypes, so list each IFC class you mean.
- You can download a file with errors, but model checkers may reject it.

BCF studio

Open, review, edit and convert BCF issue files. Read BCF 2.0, 2.1 and 3.0, edit the issues, and export BCF 2.1, Excel or CSV, or turn an Excel issue list into BCF. Everything stays in your browser.

How to use

1. Choose “Open BCF file”, “Import Excel/CSV issue list” or “Add issue”, or drop files on the page.
2. Filter with the Open, Closed and Overdue chips, the priority and assignee chips, or the search box.

3. Click an issue to edit its title, status, priority, assigned to, due date, type, labels and description, and choose “Add comment” to add a comment.
4. Tick several issues, then enter a name and choose “Assign”, or choose “Delete selected”.
5. Choose “Export BCF 2.1”, “Export Excel” or “Export CSV”. The export covers the selected issues, or all shown issues when none are selected.

Outputs

- BCF 2.1 file (.bcfzip)
- Issue list in Excel (.xlsx) or CSV

Mandatory inputs

- At least one issue: from a BCF file (.bcf, .bcfzip or .zip), an issue list (.xlsx, .csv, .tsv or .txt), or added with “Add issue”

Tips

- Files are never uploaded and the session is cleared when you leave the page, so export before you go.

Connectors

Connect to Autodesk ACC / BIM 360 Docs and to Speckle to browse files and models, check names and export lists.

Autodesk ACC / BIM 360

Browse Autodesk Construction Cloud (ACC) or BIM 360 Docs folders with read-only access, check file names against your naming convention, export file lists and start a transmittal.

How to use

1. Choose “Connect with Autodesk” and approve read-only access on Autodesk's own sign-in page.
2. Open a hub, then a project, then a folder.
3. Type in “Filter files by name” to narrow the list.
4. Choose “Check names” to check the shown files against the project code and separator in Project data.
5. Choose “Export list” for a CSV of the files with their naming results, or “Create transmittal” to open Transmittals & letters with these file names.
6. Choose “Disconnect” when you have finished.

Outputs

- File list (CSV) with location, version, last modified, size, naming check, problems and suggested name
- File names handed to the transmittal tool

Mandatory inputs

- Server settings APS_CLIENT_ID, APS_CLIENT_SECRET and APS_CALLBACK_URL (set once by an administrator)
- The APS app added as a custom integration in the ACC or BIM 360 account
- An Autodesk account with access to the project

Tips

- If no hubs appear, ask an ACC account administrator to add the app's Client ID under Custom Integrations.
- Very large folders show only the first 5,000 entries.

Speckle

Open Speckle projects, models and versions with a personal access token, count the elements by type and category, and check how complete a parameter is. No AI is used on this page.

How to use

1. Enter the “Speckle server” (leave it blank for the default server) and paste a read-only “Personal access token”.
2. Choose “Connect”.
3. Pick a project, then a model, then a version. For large models, set “Maximum objects to load” first.
4. Review the counts by speckle_type and by category.
5. Under “Parameter completeness”, choose or type a property path to see how many elements have a value.
6. Choose “Export CSV”, and choose “Forget token” when you have finished.

Outputs

- Element counts by speckle_type and by category
- Parameter completeness per type, with percentages
- CSV export

Mandatory inputs

- Personal access token with read scopes only (user.profile.read, project.core.read and project.version.read)
- Speckle server address using https (the default server is used when it is blank)

Tips

- The token is kept only in this browser tab and is removed when you close the tab.
- Versions stored in Speckle's newer bundle format cannot be analysed here. Open them in Speckle, or publish in compatibility mode.

8. AI

Purpose. The AI studio: tools that write and check information for you, each showing its sources and a result you can edit. It also covers connecting AI to authoring software and governing AI under ISO/IEC 42001.

When to use it. When you want a first draft fast, a compliance matrix, clash grouping or an audit, once your administrator has switched AI on.

Start with: EIR writer. Studio tools first, in project order from EIR to audit and programme; then connecting AI to your software; then the governance standard that applies to using AI at all.

AI studio

EIR and BEP writers, EIR to BEP compliance, model QA from IDS, clash triage, sheet QA, ISO 19650 audit, the project agent and plans from a programme.

EIR writer

Write a complete EIR and a matching AIR from a short project brief. AI drafts each section in the platform's templates and lists the assumptions and the items to confirm.

How to use

1. In “Brief”, answer the questions. Answers are prefilled from Project data, and “Reset from Project data” fills them again.
2. Choose “Next”, then tick EIR, AIR or both in “Documents”.
3. Choose “Generate” and wait while each section is written.
4. Choose “Review the result” and read each section; use “Edit” or “Regenerate this section” where needed.
5. If a section failed, choose “Retry failed sections”.
6. Choose “Download Word” for each document, or “Copy all”.

Outputs

- EIR draft (Word)
- AIR draft (Word)
- Lists of assumptions and items to confirm

Mandatory inputs

- At least one document chosen (EIR or AIR)

Tips

- Questions left blank are marked [TBC] in the document; the AI does not invent client facts.
- AI must be switched on by an administrator (Claude API key on the server).

EIR ↔ BEP compliance

Check whether a BEP answers every requirement in the EIR. AI builds a requirement-by-requirement matrix with evidence, gaps, conflicts and ready-to-paste BEP wording.

How to use

1. Upload the EIR, or paste its text.
2. Upload the BEP, or paste its text.
3. Optionally enter the “Project name” and pick the “Strictness”.
4. Choose “Build compliance matrix”. A full matrix usually takes 1–3 minutes.
5. Filter by status, category or priority, open a row to read the evidence and the gap, and tick “Accept suggestion” for the wording you want to use.
6. Choose “Export Excel”, “Export CSV” or “BEP addendum (Word)”.

Outputs

- Compliance matrix with a status for each EIR requirement: met, partial, missing or conflict
- List of conflicts between the EIR and the BEP
- Excel and CSV exports
- BEP addendum (Word) with the accepted suggestions, or with all gaps

Mandatory inputs

- EIR (PDF, DOCX, TXT or MD file up to 25 MB, or pasted text)
- BEP (PDF, DOCX, TXT or MD file up to 25 MB, or pasted text)

Tips

- AI output is decision support: the accountable person reviews it before it is relied on or issued.
- AI must be switched on by an administrator (Claude API key on the server).

Model QA from IDS (AI + BCF)

Check an IFC model against IDS requirements in your browser, get each failure explained with how to fix it, and send the issues out as BCF.

How to use

1. In “1. IFC model”, drop an .ifc file or click to choose one.
2. In “2. Requirements”, choose “Load .ids file” or “Use my IDS builder draft”, or tick IDS presets.
3. In “3. Run the check”, choose “Run check”.
4. Review the pass rate and the failing groups; filter by discipline, search, and copy the GUIDs of a group where needed.
5. Optional: in “4. Explain with AI (optional)”, pick your authoring software and choose “Explain with AI”.
6. In “5. Export”, optionally assign groups to task teams, then choose “Download BCF 2.1 (.bcfzip)” or “Download Excel report”.

Outputs

- Pass rate, failing elements and failing groups

Mandatory inputs

- IFC model (.ifc; IFC 2×3, IFC 4 or IFC 4.3; up to 500 MB)

- AI explanation, fix and priority per group (optional)
- BCF 2.1 file (.bcfzip)
- Excel report (.xlsx)

- IDS requirements with at least one checkable requirement (an .ids file, your IDS builder draft or IDS presets)

Tips

- The check itself uses no AI. Only the grouped failures are sent when you choose “Explain with AI”.
- Classification, material, optional and prohibited facets are not checked here.

Clash triage (sort the results)

Sort clash results after the clash runs. Read clash reports, group duplicates and clusters, find root causes, assign teams and priorities, and export BCF and a meeting agenda.

How to use

1. Choose “Open clash reports”, or drop one or more reports on the page.
2. Review the totals by test, status and level; tick “Include approved and resolved clashes” if you need them.
3. Under “Grouping”, set the cluster distance and choose whether to group the same element pair reported more than once.
4. Under “Triage”, edit the task teams, optionally enter the stage and tolerances, then choose “Triage with AI” or “Fill rule-of-thumb suggestions”.
5. Check each group's priority, responsible team, false positive flag, root cause and action, and edit them where needed.
6. Choose “Export BCF 2.1”, “Export Excel”, “Export CSV” or “Meeting agenda (Word)”.

Outputs

- Clash groups (duplicates and clusters) with priority, responsible team, root cause and action
- BCF 2.1 file with one topic per group
- Excel and CSV exports
- Coordination meeting agenda (Word)

Mandatory inputs

- At least one clash report (.xml, .html, .htm, .csv, .tsv, .txt or .xlsx)

Tips

- Only grouped summaries are sent to AI; the files and geometry stay in your browser.
- Grouping, manual triage and every export work without AI.

Drawing & sheet QA

Check drawing title blocks. AI reads the title block of each PDF sheet, then the portal checks the drawing number against your naming convention, the revision and status codes, the revision table, the file name, date, scale, sign-off and, optionally, your delivery plan.

How to use

1. Check the rules: “Project code”, “Originator codes (optional)” and “Field separator” are prefilled from Project data.
2. If you have a saved TIDP or MIDP, tick the delivery plan option to match the sheets against it.
3. Drop PDF drawings on the drop area, or click it to choose files.
4. Choose “Read title blocks”, or “Enter a title block by hand” if AI is not available.
5. Filter the results, and open a sheet to see each check and correct the extracted values.
6. Choose “Export Excel”, “Export CSV” or “Issues as a transmittal”.

Outputs

- Result of each check for every sheet
- Excel and CSV exports
- Transmittal list of sheets with issues, and the issues as text to copy

Mandatory inputs

- PDF drawings (.pdf, up to 25 MB each), or a title block entered by hand

Tips

- PDFs are sent to the AI service only to read the title blocks; nothing is stored.
- Check the AI confidence shown for each sheet and correct the values before you rely on them.

ISO 19650 audit

Audit a project against ISO 19650. Upload the project's evidence; AI suggests a status for each checklist item of Parts 1, 2 and 5, and you review the findings, actions and score before you export an audit report.

How to use

1. In “Scope”, tick the parts audited, choose the audited party and the stage reached, optionally enter the project name and auditor, and choose “Next”.
2. In “Evidence”, add the EIR, BEP, MIDP/TIDPs, responsibility matrix and other evidence files, and choose “Next”.
3. In “Checklist”, keep or untick the generated items, and choose “Next”.
4. In “Run”, choose “Start assessment”. You can choose “Stop after this batch” and later “Assess remaining items”.
5. In “Results”, filter by severity or part, and open an item to edit its status, severity, finding and recommended action.
6. Choose “Audit report (Word)”, “Export Excel” or “Export CSV”.

Outputs

- Status, severity, finding and recommended action for each checklist item
- Score by part
- Evidence register
- Audit report (Word), Excel and CSV exports

Mandatory inputs

- At least one part (ISO 19650-1, ISO 19650-2 or ISO 19650-5)
- Evidence files (PDF, DOCX, XLSX, TXT, MD, CSV, PNG or JPG; up to 12 files of 25 MB each)
- At least one checklist item selected

Tips

- This is decision support, not certification: the auditor reviews every item and decides.
- AI must be switched on by an administrator (Claude API key on the server).

Project agent

See what needs attention on a project: overdue and due containers, CDE changes, items awaiting review, open issues and next milestones, straight from the platform records. Ask questions in plain language and download a briefing.

How to use

1. Pick the “Project” and set “Changes since”, or choose “Last Monday”.
2. Review the totals and the panels; click a total or a panel link to open the matching project page.
3. Under “Ask the agent”, pick a suggestion or type a question and choose “Ask”. Answers cite the facts they use.
4. Choose “Download briefing” for a coordination briefing in Word.
5. Choose “New chat” to start a fresh conversation.

Outputs

- Live project totals and panels
- Answers with citations to the project records
- Coordination briefing (Word)

Mandatory inputs

- A project you are a member of

Tips

- Asking questions needs AI; the facts and the briefing work without it.

TIDP / MIDP from programme

Builds a TIDP or MIDP from the construction or design programme: each programme activity becomes the information containers it needs, with dates taken from the activity. Re-import a newer programme to see what moved.

How to use

1. Click "Load programme" and choose the programme: Primavera P6 (.xer or .xml), Microsoft Project (.xml), or a CSV / Excel export with activity id, name, start and finish.
2. Fill in the plan details (project code, originator, task team) and milestones, then pick the activities that produce information: "Select suggested" or "Select all shown" ("Clear selection" starts again).
3. Check the containers proposed for the selected activities and adjust titles, types, formats, LOIN and responsibilities in the table.
4. Click "Save to plan generator" (or "Merge into plan" when a plan already exists) to continue in the TIDP / MIDP generator.
5. When the programme changes, click "Load new programme version": changed dates and new or removed activities are listed, and "Apply new dates" updates the containers.
6. Export with "Excel (.xlsx)" (MIDP / TIDP template layout with a Programme link sheet) or "CSV".

Outputs

- Excel workbook in the MIDP / TIDP template layout, plus a Programme link sheet (activity → containers)
- CSV with the activity for each container
- A list of programme changes between two versions

Mandatory inputs

- A programme file (.xer, .xml, .csv, .txt or .xlsx) with activity names and dates

Tips

- Activities without dates cannot drive container dates; fix them in the programme or enter dates by hand.

Connect AI to BIM software

How to connect Claude or ChatGPT to Revit, AutoCAD, Navisworks and Civil 3D, what MCP is, and a setup tool.

Connect AI to Revit, AutoCAD, Navisworks & Civil 3D

A learning hub on using AI assistants such as Claude and ChatGPT with Revit, AutoCAD, Navisworks and Civil 3D: the ways to connect, installing and connecting, worked examples, limits, and security and governance.

How to use

1. Pick a section (Overview, Revit, AutoCAD, Navisworks, Civil 3D, Security & governance, or FAQ & resources), then a topic tab.
2. Use the search box to find a topic, and the Next link at the bottom to move through the hub in order.
3. Tick the checklist items as you go, take the quiz, and ask the AI tutor in the “Links & ask AI” tab.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Your progress, checklists and quiz score are saved in this browser.

Connect AI to BIM tools (MCP)

A learning hub on the Model Context Protocol (MCP): what it is, how to add servers in Claude Desktop and Claude Code, BIM-related servers, ISO 19650 use cases, and security and governance.

How to use

1. Work through the tabs: What is MCP, Connect in Claude Desktop, Connect in Claude Code, BIM-related MCP servers, ISO 19650 use cases, Security & governance, Setup checklist and FAQ.
2. Use the search box to find a topic, and the Previous and Next links at the bottom to move between tabs.

3. Tick the items in “Setup checklist” before you connect a server to live project information.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Commands and menus change between versions, so check them against the version you have installed.

Connect via MCP (setup tool)

The MCP setup guide inside the AI tools: how to connect Claude to Revit, IFC, CDE and other BIM tools with the Model Context Protocol, step by step, next to the other AI tools.

How to use

1. Open “Connect in Claude Desktop” or “Connect in Claude Code” and follow the steps to add an MCP server.
2. Read “BIM-related MCP servers” to choose a server, and “Security & governance” before you connect it.
3. Tick the items in “Setup checklist” as you go.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- This guide works even when AI is not switched on in the portal.

AI governance

Everything on ISO/IEC 42001 in one place: the learning hub, clauses 4 to 10, Annex A controls, AI in BIM and the glossary.

ISO/IEC 42001 learning hub

A learning hub on ISO/IEC 42001, the AI management system standard: what an AIMS is, clauses 4–10, Annex A controls, AI in BIM, an implementation roadmap, an FAQ, a quiz and an AI tutor.

How to use

1. Pick a section (Overview, Clauses 4–10, Annex A controls, AI in BIM, Implementation, or FAQ, quiz & AI), then a topic tab.
2. Study the worked examples, such as the AI system inventory and the impact assessment, and tick the checklists as you go.
3. Take the quiz, and in “Ask AI & generate” ask the AI tutor or choose “Open in AI document generator” to draft an AI policy.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Your progress, checklists and quiz score are saved in this browser.

Clauses 4–10

Paraphrased summaries of ISO/IEC 42001 clauses 4 to 10, the requirements for establishing, running and improving an AI management system (AIMS).

How to use

1. Click a clause to expand it and read its summary and sub-clauses.
2. Type in “Search this section…” to filter the clauses; matching clauses open automatically.
3. Use the tabs to switch to Annex A controls, AI in BIM or the glossary.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Summaries are paraphrased for guidance; always refer to the licensed standard.

Annex A controls

The Annex A reference controls of ISO/IEC 42001, grouped by objective, with the purpose of each control.

How to use

1. Click a control group to expand it and read its controls.
2. Type in “Search this section…” to find a control by number, title or objective.
3. Follow the Statement of Applicability template link to record which controls apply to you.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Controls are selected from your risk assessment; record why each one applies or not in the Statement of Applicability.

AI in BIM

A table of AI use cases in BIM workflows, each with an indicative risk and a control approach. ISO 19650 governs the information; ISO/IEC 42001 governs the AI that produces or processes it.

How to use

1. Read the table: AI use case in BIM, indicative risk and control approach.

2. Type in “Search this section…” to filter the use cases.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

ISO/IEC 42001 glossary

Terms and abbreviations used in ISO/IEC 42001, with short definitions.

How to use

1. Scroll the table of terms and definitions.
2. Type in “Search this section…” to find a term, an abbreviation or a word in a definition.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

9. Resources

Purpose. Calculators for fees, carbon and readiness, plus client standards, news and careers. Use them for proposals, assessments and keeping up to date.

When to use it. When you prepare a fee or proposal, assess maturity or readiness, or look for client standards and news.

Start with: BIM maturity assessment. Calculators first because they produce numbers for your work; industry and career pages after.

Calculators

BIM fee estimate, embodied carbon (6D), BIM maturity, digital twin readiness and scan-to-BIM readiness.

BIM fee estimator

Estimate the effort and fee for BIM and information management services, scaled by floor area and complexity. Adjust the rates to your market.

How to use

1. Enter the “Gross floor area (m²)”, “Complexity”, “Day rate” and “Programme (months)”.
2. Turn the “Services” chips on or off.
3. Read the days and fee for each service, the total, the fee per m² and the average FTE.
4. Choose “⬇ CSV” to export the estimate.
5. To keep it, pick a project under “Save to project”, enter a title and choose “Save”; choose “Load” to reopen a saved estimate.

Outputs

- Days and fee per service, with the total, fee per m² and average FTE
- Estimate as CSV
- Estimate saved to a project

Mandatory inputs

- To save to a project: a title (1–160 characters) and editor rights on the project

Tips

- The figures are indicative; set the day rate to your own.

Embodied carbon (6D)

Estimate upfront embodied carbon (A1–A3) from material quantities, such as a quantity take-off exported from the models. The factors are typical values; replace them with product EPD values where you have them.

How to use

1. Enter the GIFA (m²).
2. For each row, pick the material, enter the quantity and, if you have one, your own factor; choose “+ Material” to add a row.
3. Read the total tCO_2e, the $kgCO_2e/m^2$ GIFA and the indicative band.
4. Choose “⬇ CSV” to export, or save the estimate to a project under “Save to project”.

Outputs

- Total tCO_2e and $kgCO_2e$ per m² GIFA
- Indicative band from A (excellent) to E (very high)
- CSV export
- Estimate saved to a project

Mandatory inputs

- GIFA in m² (above 0, for the per-m² figure and the band)
- To save to a project: a title (1–160 characters) and editor rights on the project

Tips

- Use EPD factors for the main products to make the estimate more reliable.

BIM maturity assessment

Assess how far ISO 19650 is embedded in your organisation, across strategy and leadership, process, people and technology.

How to use

1. Rate each statement from 0 (not at all) to 5 (fully, consistently).
2. Read the overall score out of 5, the maturity level and the score for each area.
3. Start your improvement plan with the focus area shown; choose “Reset” to clear the answers.

Outputs

- Overall score out of 5 and maturity level (0 Not started to 5 Optimised)
- Score per area and the focus area to improve first

Mandatory inputs

Nothing is mandatory.

Tips

- Answers stay in this browser.

Digital twin readiness

Assess an asset owner's readiness to operate a digital twin, across asset information, data and integration, use cases, and governance and security.

How to use

1. Rate each statement from 0 (not at all) to 5 (fully, consistently).
2. Read the overall score out of 5, the level and the score for each area.
3. Start your improvement plan with the focus area shown; choose “Reset” to clear the answers.

Outputs

- Overall score out of 5 and level (0 Not started to 5 Optimised)
- Score per area and the focus area to improve first

Mandatory inputs

Nothing is mandatory.

Tips

- Answers stay in this browser.

Scan-to-BIM readiness

Assess readiness to capture and model existing conditions, across scope, survey control, and modelling and QA.

How to use

1. Rate each statement from 0 (not at all) to 5 (fully, consistently).
2. Read the overall score out of 5, the level and the score for each area.
3. Start your improvement plan with the focus area shown; choose “Reset” to clear the answers.

Outputs

- Overall score out of 5 and level (0 Not started to 5 Optimised)
- Score per area and the focus area to improve first

Mandatory inputs

Nothing is mandatory.

Tips

- Answers stay in this browser.

Industry & careers

Client information standards, BIM and ISO 19650 news, your opt-in talent profile and the recruiter talent pool.

BIM & ISO 19650 news

Recent news on BIM, ISO 19650 and information management, found by AI web search. Each story has a summary, a relevance rating and the ISO 19650 parts it affects.

How to use

1. Pick a topic chip, or “All”, and set the relevance filter.
2. Read the summaries and choose “Read source ↗” to open the original story.
3. Choose “Search news now” to refresh the feed; it is shown when AI is on and refreshes at most once an hour.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- Always read the original source before you act on a story.

My talent profile

An optional profile that approved recruiters can search. You choose whether it is listed, and you are notified every time someone opens it.

How to use

1. Tick “List my profile in the talent pool” to make it searchable, and tick “Show my best Learn results (mock exam and topic scores)” if you want to share them.
2. Fill in the headline, skills, certifications, years of experience, location and availability.
3. Choose “Save”.
4. Check “Who viewed my profile”, and choose “Delete profile” to remove it.

Outputs

- Talent profile listed in the talent pool
- List of who viewed your profile

Mandatory inputs

Nothing is mandatory.

Tips

- Your email is shown to recruiters only when you are open to offers or available now.

Talent pool (recruiters)

Search the professionals who chose to list a talent profile. For recruiters approved by an administrator.

How to use

1. Type in “Search skills, certifications, location...” and pick an availability.
2. Click a card to open the full profile; the person is notified that you viewed it.
3. Use the contact email shown when the person is open to offers or available now.

Outputs

Reading page: no files or records produced.

Mandatory inputs

- Recruiter role on your account (given by an administrator)

Tips

- Learn results appear only when the person chose to show them.

10. My work

Purpose. Your own starting point: today's work, recent pages and your projects in one place. Nothing here needs setting up except a saved delivery plan for My Day.

When to use it. Every morning, and whenever you want to get back to where you left off.

Start with: Home. Inside My work: Home first because it is where you land, then this guide, then the two dashboards that fill up as you use the platform. The sidebar puts learning first and your own work near the end, just above your projects.

My work

Home, this guide, My Day (what is due from your delivery plan) and Portfolio (health across your projects).

Home

Your start page: what is due today, pages you opened recently, items that need your attention and your projects.

How to use

1. Work through the “Get started” card: “Read the platform guide”, “Set your role”, “Create a project” and “Draft your first EIR”.
2. Use the quick buttons such as “New project”, “Check file names” or “Draft a document” to jump straight to a tool.
3. Check the “Today” card for overdue containers, containers due this week and items assigned to you; click “Open My Day →” for the full list.
4. Click a page under “Continue where you left off” to return to it.
5. Open an item under “Needs your attention” to act on a review request, an assigned issue or a mention.
6. Open a project under “Projects”, or click “View all →” to see every project.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- The Today card counts due containers only after you save a TIDP or MIDP in the plan generator.
- The “Get started” card disappears when all four steps are done.

Platform guide

Explains what every sidebar section is for and where to begin, with a first-day checklist, a first-week plan, how the pages connect, routes by role and common questions.

How to use

1. Start on the “Start here” tab to learn the parts of the sidebar: account menu, search and Ask AI, Favourites, View by role, sections and Help & support.
2. Open “Every section” to read each section's purpose, when to use it and its pages; click a page name to open it.
3. On “First day”, do the steps in order: click “Open” on each one and tick it when it is done.
4. Use “First week” for a day-by-day plan with links to the pages for each day.
5. Open “How it fits together” to follow how information entered on one page flows into the next.
6. Use “By role” to open your “Learning path” and “Role profile”, and “FAQ” to search questions with “Search questions...”.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

Tips

- First-day ticks are saved in this browser only.
- Press Ctrl+K anywhere to jump to any page, template or project.

My Day

Shows what is due from your delivery plan and what is waiting on you in projects: reviews, containers, issues, meeting actions and risk reviews.

How to use

1. Choose the plan in the drop-down: “Plan generator (this browser)” or a project's MIDP / TIDP planner; click “Refresh” to reload a project plan.
2. Read the counters “Overdue”, “Due in the next 7 days”, “Due in 8–14 days” and “No due date”; click one to list only those containers.
3. For a plan from the plan generator, change a container's status in the “Status” drop-down; for a project plan, change it in the project with “Open the project planner →”.
4. Under “Assigned to you in projects”, click a type counter to filter the list, then click an item to open it.
5. Use the quick links at the top (“Check file names”, “Check a model”, “Delivery plans”, “Project data”) for daily tasks.

Outputs

- Updated container statuses in the TIDP or MIDP saved in this browser (plan generator plans only).

Mandatory inputs

Nothing is mandatory.

Tips

- Containers without a due date never show as due: add due dates in the plan generator.

Portfolio

Shows information delivery health across all your projects in one table.

How to use

1. Read the totals at the top: projects, information containers, overdue containers and open issues.
2. Check the dot at the start of each row: it flags a problem when a project has overdue containers, high-priority issues, high risks or model quality under 60%, and a caution when it has more than 10 open issues or quality under 80%.
3. Compare the columns “Your role”, “Delivery progress”, “Overdue”, “Open issues”, “Model quality”, “Requirements delivered” and “High risks”.
4. Click a project name to open its overview.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

11. Account & settings

Account

My profile

Manage your account: profile details, password, email notifications, language, your projects and your personal data.

How to use

1. Edit your details under “Profile details” and choose “Save profile”.
2. To change your password, enter the current password and the new one twice, then choose “Change password”.
3. Set “Email notifications” (instant, daily digest or off) and “Language”; these are saved at once.
4. Open a project from “My projects”.
5. Choose “Download my data” for a copy of your data, or “Delete my account…” to erase your account.

Outputs

- Updated profile and preferences
- Copy of your data (.json)

Mandatory inputs

- Full name (2–120 characters)
- To change the password: your current password and a new password of at least 8 characters, entered the same twice
- To delete the account: your password and the word DELETE

Tips

- Deleting your account cannot be undone.

Help & support

Ask a question, report a problem or suggest an idea, and see the replies from administrators.

How to use

1. Under “New request”, choose Question, Problem or Idea.
2. Describe what you need, and choose “Attach screenshot” or paste an image if it helps.
3. Choose “Send”.
4. Follow your requests and the replies under “My requests”; you get a notification when an administrator replies.

Outputs

- Support request sent to the administrators, with your screenshot if attached

Mandatory inputs

- Message (5–4,000 characters)

Tips

- Screenshots must be PNG or JPEG images.

Plans & pricing

Compare the plans and what each one includes. Every paid plan is billed yearly and can be upgraded at any time.

How to use

1. Read the plan cards and the “Compare plans” table.
2. Open the “Pricing questions” for answers about billing.
3. Choose “Your plan & billing” or the upgrade button on a plan card to change your plan.

Outputs

Reading page: no files or records produced.

Mandatory inputs

Nothing is mandatory.

About the portal

Who makes the portal, what the team believes and what the portal covers, with a form to contact the team.

How to use

1. Read “What we believe” and “What the portal covers”.
2. To contact the team, fill in the form under “Talk to us” and choose “Send message”.

Outputs

- Message sent to the portal team

Mandatory inputs

- To send a message: Name (at least 2 characters) and a valid Work email

12. Document template library

Every template opens as a structured form with ISO clause references, quality checks and Word export. Templates marked “generated” are produced from project data rather than typed.

Code	Template	Standard	Category	Purpose	Clauses
BEP-PRE	BIM Execution Plan (Pre-appointment)	ISO 19650	Plans	Tender-stage plan demonstrating how the prospective delivery team will meet the EIR (team, strategy, standards, CDE, IT, capability, risks).	19650-2 §5.3.2
BEP-POST	BIM Execution Plan (Post-appointment)	ISO 19650	Plans	Confirmed BEP after appointment: named roles, confirmed strategy and methods, delivery schedule, handover and risks.	19650-2 §5.4.1
CCA	Capability & Capacity Assessment	ISO 19650	Tender	Assesses each prospective task team's information management capability, technology and capacity.	19650-2 §5.3.3, §5.3.4
HOS	Information Handover Strategy	ISO 19650	Close-out	How the project information model becomes the asset information model: scope, timing, formats, verification and acceptance.	19650-2 §5.7, §5.8, 19650-3 §5.7
SEC	Security Triage & Security Management Plan	ISO 19650	Security	ISO 19650-5 sensitivity assessment: decide whether a security-minded approach is needed and, if so, the controls for sharing information.	19650-5 §4, §5, §6
SPEC	BIM Specification & Scope of Services	ISO 19650	Contract	Contract BIM specification: general requirements, project database, data extraction, contractor roles, post-contract BIM management and construction progress monitoring, plus services by stage.	19650-2 §5.2.3, §5.4.6
OIR	Organizational Information Requirements	ISO 19650	Requirements	Captures the strategic information the appointing party needs to run its business and its asset portfolio, and which later drives the AIR and PIR.	19650-1 §5.2, 19650-3 §5.1
AIR	Asset Information Requirements	ISO 19650	Requirements	Defines the managerial, commercial and technical information needed about assets, feeding the asset information model (AIM).	19650-1 §5.3, 19650-3 §5.1.5
EIR	Exchange Information Requirements	ISO 19650	Requirements	Sets out the appointing party's information requirements for an appointment: what, when, how and to what level of need.	19650-2 §5.2.1, 19650-2 §5.1

Code	Template	Standard	Category	Purpose	Clauses
PIS	Project Information Standard	ISO 19650	Standards	Defines naming, metadata, classification, formats, status codes and modelling rules for all information containers.	19650-2 §5.1.4, UK NA
CDE	CDE Workflow & Procedure	ISO 19650	Standards	Defines the CDE solution, states, transitions, approvers, folder structure and access rules.	19650-1 §12, 19650-2 §5.1.7, 19650-4
IP	Information Protocol	ISO 19650	Contract	Defines obligations, licences and liabilities for information, incorporated into each appointment.	19650-2 §5.1.8
INF	Infrastructure Information Requirements	ISO 19650	Specialist	Addendum to the EIR and information standard for linear and civil assets: breakdown by section and chainage, survey and coordinates, IFC 4.3 and GIS exchange.	19650-2 §5.2.1, 19650-2 §5.1.4, ISO 16739-1 (IFC 4.3)
FAC	Façade Information Requirements	ISO 19650	Specialist	Addendum for façade design and specialist contractor packages: panel identification, interfaces, performance information and fabrication-to-handover exchanges.	19650-2 §5.2.1, 19650-2 §5.4.2
DRM	Detailed Responsibility Matrix (generated)	ISO 19650	Plans	Defines who produces which information, when and to what level of information need.	19650-2 §5.4.2
TIDP	Task Information Delivery Plan (generated)	ISO 19650	Plans	Task team schedule of information containers, durations and dependencies.	19650-2 §5.4.4
MIDP	Master Information Delivery Plan (generated)	ISO 19650	Plans	Aggregates all TIDPs into one plan aligned with delivery milestones.	19650-2 §5.4.5
MOB	Mobilization Plan	ISO 19650	Tender	How resources, IT and methods will be mobilized and tested.	19650-2 §5.3.5, §5.5
RR	Information Delivery Risk Register (generated)	ISO 19650	Tender	Risks to timely delivery of information and their mitigation.	19650-2 §5.3.6
IU	Information Uses Schedule (generated)	ISO 19650	Plans	The purposes for which information is produced on this project, with priority, responsible task teams, deliverables and information need.	19650-1 §5.1, 19650-2 §5.1.2, §5.3.2
MRM	Model Responsibility Matrix (generated)	ISO 19650	Plans	Which task team models each element, and to what level of development, at each milestone.	19650-2 §5.3.2, §5.4.2, §5.4.4

Code	Template	Standard	Category	Purpose	Clauses
MOM	BIM Meeting Minutes (generated)	ISO 19650	Meetings	Record of a BIM meeting: attendees, agenda with minutes, and actions with owners and due dates.	19650-2 §5.6
BPR	BIM Progress Report (generated)	ISO 19650	Meetings	Periodic report on information delivery, quality, coordination and risks — compiled from live project data.	19650-2 §5.6, §5.7
QA	Information Container QA Checklist	ISO 19650	Quality	QA check before a container moves from WIP to Shared.	19650-2 §5.6.3
LL	Lessons Learned Report	ISO 19650	Close-out	Captures lessons for future projects at close-out.	19650-2 §5.8.2
MPDT	Model Production and Delivery Table	ISO 19650	Plans	States who models which element, to what level of information need, at each stage — the element-level companion to the responsibility matrix.	19650-2 5.4.2, ISO 7817-1
AI-CTX	Context, Interested Parties & AIMS Scope	ISO/IEC 42001	Context	Documents internal/external issues, interested parties and the AIMS scope.	42001 §4.1, §4.2, §4.3
AI-INV	AI System Inventory	ISO/IEC 42001	Context	Register of all AI systems developed, provided or used by the organization.	42001 §4.1, A.4.2
AI-POL	AI Policy	ISO/IEC 42001	Leadership	Top-level AI policy providing a framework for AI objectives.	42001 §5.2, A.2.2
AI-RACI	AIMS Roles & Responsibilities	ISO/IEC 42001	Leadership	Allocates AIMS roles and responsibilities.	42001 §5.3, A.3.2
AI-RISK	AI Risk Assessment & Treatment Plan	ISO/IEC 42001	Planning	Identifies, analyses and evaluates AI risks and records treatment.	42001 §6.1.2, §6.1.3, §8.2, §8.3
AISIA	AI System Impact Assessment	ISO/IEC 42001	Planning	Assesses consequences of an AI system for individuals, groups and society.	42001 §6.1.4, §8.4, A.5, ISO/IEC 42005
SoA	Statement of Applicability (Annex A)	ISO/IEC 42001	Planning	Lists all Annex A controls with applicability, justification and implementation status.	42001 §6.1.3
AI-OBJ	AI Objectives Plan	ISO/IEC 42001	Planning	Measurable AI objectives and how they will be achieved.	42001 §6.2
AI-LC	AI System Life Cycle Procedure	ISO/IEC 42001	Operation	Responsible design, development, verification, deployment and monitoring of AI systems.	42001 §8.1, A.6, A.7
AI-AUD	Internal Audit Plan & Report	ISO/IEC 42001	Evaluation	Plan and report internal audits of the AIMS.	42001 §9.2

Code	Template	Standard	Category	Purpose	Clauses
AI-MR	Management Review Minutes	ISO/IEC 42001	Evaluation	Records top management review of the AIMS.	42001 §9.3
AI-CAPA	Nonconformity & Corrective Action Log	ISO/IEC 42001	Improvement	Tracks nonconformities, root causes and corrective actions.	42001 §10.2

13. Frequently asked questions

Clash test matrix, clash triage or the project's clash matrix — which do I use?

Before clash detection runs, plan the tests with the Clash test matrix (Documents & delivery › Create). After a run, load the Navisworks or CSV report into Clash triage (AI › AI studio) to group results by root cause and send BCF issues. The project's own clash matrix keeps the agreed tests for that project.

Which model checker should I use?

QA/QC model checker grades general model health A–F. IFC Hub lets you explore one model and compare it with the EIR and LOIN. Model QA from IDS checks a model against your IDS requirements, explains each failure and exports BCF. The Revit project check runs inside Revit with a read-only pyRevit button.

Document generator, EIR writer or BEP from EIR?

Use the EIR writer to produce a full EIR and AIR from a short brief, and BEP from EIR to answer a client's EIR point by point. Use the Document generator for any other ISO 19650 document. Then check an EIR and BEP pair with the EIR ↔ BEP compliance matrix.

Which plan does My Day use?

The one chosen at the top of My Day: the plan generator in this browser, or a project's MIDP / TIDP planner. The project planner also has a "Use this plan in My Day" button. The Today card, the file naming checker and sheet QA follow the same choice.

Where do I start?

Follow the First day tab of this guide, in order. Home also shows a short Get started card until your role, first project and first EIR are done.

See: Platform guide · Home

Do I need a project to use the tools?

No. Everything under Documents & delivery, Models & coordination, AI, ISO standards & learning and Resources works without a project. You need a project for the pages in the Projects section: CDE files, controlled documents, issues, the project planner, team and gates.

See: Create a project

Where is my data stored: browser or server?

Projects and everything inside them, your profile, role and favourites are stored on the server and shared with your project team. Project data (enter once), the plan saved by the TIDP / MIDP generator, Revit check rules, learning progress, checklist ticks and sidebar preferences stay in this browser only: they do not follow you to another device and are lost if you clear site data.

See: Project data (enter once) · TIDP / MIDP / MPDT generator

Which tools use AI, and does it cost anything?

Pages marked (AI), the AI studio and the Generate with AI buttons in the generators use AI. Your administrator must add a Claude API key to the server first; until then these pages say so and everything else works. Each AI request counts towards your plan's monthly AI allowance, shown on Plan & billing.

See: EIR writer

Can I work without AI?

Yes. Workflows, document guides, templates, the naming checker, model checks, IDS and BCF tools, calculators and all learning content work without AI. The delivery plan generator has a standard starter list that needs no AI.

See: TIDP / MIDP / MPDT generator · File naming checker

How do I switch to Arabic?

Open My profile from the account menu and choose Arabic under Email & language, or pick the language on the sign-in page. The layout switches to right to left; any text not yet translated stays in English.

See: My profile

What is a favourite?

A page pinned to the Favourites list at the top of the sidebar. Use the Add to favourites button at the top right of any menu page to pin or unpin it. Favourites are saved in your profile, so they follow you to any browser.

How do roles filter the menu?

Set my role (account menu or Home) saves your BIM role and adds its tools to Favourites. The View by role chips in the sidebar only change what the menu shows; choose All to see every page again.

How do I find a page fast?

Press Ctrl+K (Cmd+K on a Mac) to search every page, template and project by name. The search box at the top of the sidebar filters the menu. Ctrl+\ hides or shows the sidebar.

What is the difference between Documents & delivery and the Projects section?

Documents & delivery holds tools and guides you can use any time, without saving anything for a team. The Projects section holds one project's records on the server: controlled documents, files, plan, issues and team.

See: Project workflow · Summary

Why is My Day empty?

My Day reads the TIDP or MIDP saved by the TIDP / MIDP / MPDT generator in this browser, plus items assigned to you in projects. Save a plan in the generator and it fills up.

See: TIDP / MIDP / MPDT generator · My Day

Which delivery plan tool should I use?

Use the TIDP / MIDP / MPDT generator to build and save a plan that feeds My Day and the checks. Use TIDP / MIDP from programme to turn an MS Project or P6 programme into a plan. Use the project's MIDP / TIDP planner to keep the plan with the project for the whole team.

See: TIDP / MIDP / MPDT generator · TIDP / MIDP from programme · MIDP / TIDP planner

Where are the templates?

Under Documents & delivery, Templates & samples: the ISO 19650 and ISO/IEC 42001 template libraries, sample documents and downloads. Every template also has its own page you can find with Ctrl+K.

See: ISO 19650 templates · Sample documents

Where do I learn ISO 19650 from scratch?

Pick the learning path for your role, then work through the parts hub from Part 1. Use the glossary whenever you meet an acronym.

See: Learning paths by role · All parts (1–6): learning hub · Glossary & acronym decoder (EN/AR)

How do I get help?

Use Help & support at the bottom of the sidebar to ask a question or report a problem; replies appear there. Ask AI at the top of the sidebar searches the built-in ISO knowledge base.

See: Help & support
